Archaic cuneiform numbers

Robin Leroy, Anshuman Pandey, and Steve Tinney

Contents

1 Summary

2 Background

The Unicode Standard includes some cuneiform numbers: 𒁹–𒐎 1–9(diš) and 𒀸–𒐇 1–9(aš), 𒌋–𒐐 1–5(u), 𒐕–𒐝 1–9(ŋeš$_2$), 𒐞–𒐢 1–5(ŋešʾu), etc., used in the Sumero-Akkadian Cuneiform script (ISO 15924: Xsux, Script property value long name: Cuneiform).

In the investigation that led to their encoding in Unicode Version 5.0, it was thought appropriate to unify these with the earlier curviform numerals – 1–9(aš^c = N_1), – 1–5(u^c = N_{14}), – 1–9(ŋeš$_2$^{c} = N_{34}), – 1–5(ŋešʾu^c = N_{48}), etc., see L2/04-099. While the curviform numerals sometimes co-occur with the cuneiform ones, this was analysed as a stylistic distinction which should not be encoded in plain text. It has now become apparent that a distinction needs to be

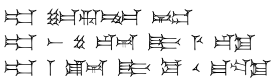
made for the adequate representation of Early Dynastic (ED) texts and scholarship pertaining to them.

In addition, these numerals will be needed for the representation of proto-cuneiform texts from the earlier archaic period. The non-numeric signs of proto-cuneiform (ISO 15924: Pcun) will be the subject of a separate proposal; we need only note here that the divergence between the approaches to character identity in modern scholarship requires that proto-cuneiform be disunified from cuneiform: proto-cuneiform is effectively treated as an undeciphered script. In contrast, the cuneiform encoding model is semantic, requiring an understanding of the text to correctly encode it.

The use of the curviform numeric signs is however understood, as we will discuss in Section 3; further, the conventions used for archaic numerals are also used when discussing ED numerals, see Section 7. As a result, the same numerals can be used when encoding archaic and ED texts, and in order to avoid issues ambiguities in representation when converting from transliteration, these should be unified. The overall picture of unifications and disunifications would be as follows:

	Uruk III & earlier	ED – Ur III	OB & later
Non-numeric signs	Future Pcun	Existing Xsux	
Numbers	This proposal	This proposal + Existing Xsux	Existing Xsux

3 Metrologies



I want to write tablets: the tablet of 1 gur *of barley to 600* gur*; the tablet of 1 shekel of silver to 10 minas [...]*

Edubba'a D

In order to explain why TODO:*n* more numerals are needed, it is useful to first recall why we have so many kinds of cuneiform numerals already.

As is well known[1] a sexagesimal place value system (SPVS) was used in Mesopotamia from the late third millenium onwards. One should bear in mind, however, that other systems were used; the SPVS was primarily used in calculations, with results being expressed in non-positional systems [Rob08, p. 76; Rob22]. The digits 1–59 of the SPVS have inner structure which is reflected in the encoding: the digits 1–9 are the individual characters 𒁹–𒑆, the multiples of ten (10–50) are 𒌋–𒐐, but the other digits 11–59 are sequences 𒌋𒁹–𒐐𒑆; in effect the base-sixty digits are themselves written in base ten, with a different set of symbols for the tens place. This reflects the origin of the sexagesimal place value system; it derives from a *non-positional* system, hereafter the *cuneiform discrete counting system* $S_{\text{Ur III/OB}}$, which had different signs for the units 𒁹–𒑆, tens 𒌋–𒐐, sixties 𒐕–𒐞 (with larger wedges than the units), six hundreds 𒐟–𒐣, three thousand six hundreds 𒊹–𒐩, and thirty-six thousands 𒐪–𒐬.

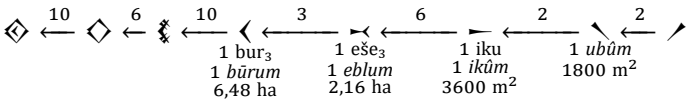
[1]See, *e.g.*, *The Unicode Standard*, Version 16.0, Section 22.3.3 *Non-Decimal Radix Systems*, *sub* "Cuneiform Numerals".

The relations between the values of the signs in the cuneiform discrete counting system may be summarized by the following factor diagram[2], where the number over arrow indicates the multiple of the preceding sign (right of the arrow) corresponding to the following sign (left).

($S_{\text{Ur III/OB}}$)

For example, the number $1729 = ((2 \times 10 + 8) \times 6 + 4) \times 10 + 9 = 28 \times 60 + 49$ would be written  in the discrete counting system, and  in the sexagesimal place value system.

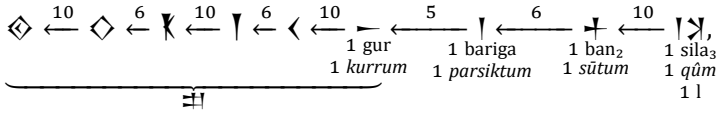
The discrete counting system was not the only non-positional system in use in the Ur III and Old Babylonian periods; different systems were in use depending on what was being counted or measured. For instance, field areas were measured using the following system, where for the named units we have provided the name of the unit in transliterated Sumerian, normalized Old Babylonian Akkadian, and the approximate metric equivalent:



($G_{\text{Ur III/OB}}$)

Note that for the range of areas given above[3], this system does not use any symbols separate from the numerals for the individual units (*ubûm*, *ikûm*, *eblum*, and *būrum*). The whole numeric expression for the area would be followed by the sign  functioning as punctuation, but the numerals are tied to the metrology; thus a surface of 5 *būrū* 1 *eblum* 4 *ikû* (100 *ikû*, 36 ha) would be written[4]  . Contrast this with systems where the same numerals are used for different units, and overt units are used, as in "88 acres 3 roods 33 perches". Note also that the same signs are shared between multiple systems, with different relations; the ŠAR_2 sign  is equal to sixty times the U sign  in the area system, but to three hundred and sixty times in the discrete counting system.

Another such system of note is the one for capacities[5] [Fri07, p. 376; Rob19],



($C_{\text{Ur III/OB}}$)

where the numerals for ban_2 are , ,  ,  , and , and those for bariga are , , , and (contrast ordinary and otherwise used with -numerals). Note that

[2]These diagrams, which have become standard in discussions of Mesopotamian metrology, originate with [Fri78, p. 10], where they are called *step-diagrams*.

[3]For areas smaller than a quarter *ikûm*, an overt unit is used, with 1 *mūšarum* (36 m^2) written , equal to one hundredth of an *ikûm*, then sexigesimally subdivided in 60  (shekels). For areas greater than 3600 *būrū*, the - and -numerals are reused with a suffix (gal, Sumerian: big), as follows:

see [Rob08, p.295 with notes b and c; Fri07, p. 378; Rob19].

[4]As in the surface of the field of (Apisal) reported on P102305 r. 1.

[5]Used for volumes of grain, but also oil, dairy products, beer, etc., as well as to express the capacity of boats; volumes of earthworks instead use $G_{\text{Ur III/OB}}$ based on a height of one cubit, see[Pow87, p. 488; Rob08, p. 294; Rob19].

while it is used only with volumes in excess of one gur, the sign GUR 𒄥 is written after the whole expression, after the overt unit sign 𒋡 if present, and after the word for "grain" if present, as in 𒐐𒐎𒌋𒐂𒑋𒐚𒋡𒊺𒄥 (3554 gur 3 ban_2 6 $sila_3$ of grain[6]), see [Hue11, p.585 with notes (b) and (f)]. Observe that while large numbers of gur follow[7] system $S_{\text{Ur III/OB}}$, the use of horizontal (AŠ) numerals for the gur disambiguates with the vertical bariga, as 𒌋𒁹𒄥 would be 10 gur 1 bariga, and 𒌋𒀸𒄥 would be 11 gur; again even with some overt units, most of the numerals are tied to the metrology.

This intertwining of units and numerals explains the large number of already-encoded numeral series:

— 𒐕–𒐝 used in $S_{\text{Ur III/OB}}$ and the SPVS as well as with overt units;
— 𒌋–𒐔 used in $G_{\text{Ur III/OB}}$, of which 𒌋–𒐐 are also used in $S_{\text{Ur III/OB}}$ and the SPVS as well as with overt units;
— 𒁹–𒐎 used in $S_{\text{Ur III/OB}}$ and the SPVS;
— 𒀸–𒐇 used in $C_{\text{Ur III/OB}}$ as well as in the weight system;
— 𒑊, 𒑋, 𒑌, 𒑍, 𒑎 used in $C_{\text{Ur III/OB}}$;
— 𒑏, 𒑐, 𒑑, 𒑒 used in $C_{\text{Ur III/OB}}$—note the overlap with 𒐕–𒐝;
— 𒑘 and 𒑙 used in $G_{\text{Ur III/OB}}$.

4 Arguments for curviform-cuneiform unification

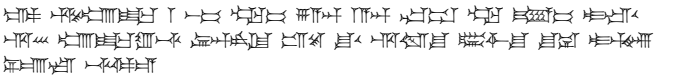
(S)

($G_{\text{ED IIIb}}$)

[6]From P309594.
[7]A larger unit, the $guru_7$ (*karûm*, grain heap), is sometimes used instead, with 𒀸𒂔𒆸𒄥 (1 *karûm* = 3600 kurrū). See [Fri07, p. 415; Rob19].

5 Problems with unification: Early metrology

6 Problems with unification: Non-numeric usage



The beginning of the scribal art is a single wedge. That one has six pronunciations; it also stands for 'sixty'. Do you know its reading?

Examenstext A

6.1 The case of ŠAR_2

7 Compatibility with transliteration

8 The necessity of ED–Uruk numeral identification

9 Characters not included in this proposal

9.1 Missing numerals

(N_{17}, $12N_{14}$, etc.)

9.2 Stacking patterns

(… are a mess, vary within Uruk, and are not transliterated/documented by Englund, so let's not go there for now.)
