1 Summary

This document proposes encoding some numerals used in the Uruk and Early Dynastic periods in conjunction with the Sumero-Akkadian cuneiform script¹ and the proto-cuneiform script². The proposed characters are listed in section 2.

The non-numeric signs of proto-cuneiform will be the subject of a separate proposal; we need only note here that the divergence between the approaches to character identity in modern scholarship requires that proto-cuneiform be disunified from cuneiform: proto-cuneiform is effectively treated as an undeciphered script. In contrast, the cuneiform encoding model is semantic, requiring an understanding of the text to correctly encode it.

However, the *numerals* used in proto-cuneiform should be unified with ones used in the Early Dynastic period, for the reasons set forth in section 4. The proposed “curved”, or “curviform”, numerals³ should however *not* be unified with the already-encoded cuneiform numerals⁴. Since the encoding proposals for the cuneiform script twenty years ago provisionally considered the curviform numerals to be glyph variants of the cuneiform numerals, a detailed rationale is provided in section 3, including compatibility considerations in section 3.7.

The overall picture of unifications and disunifications over time is illustrated in table 1. The Script_Extensions property assignments in section 2.2 reflect the overlap.

[TODO(egg): Mention the other sections here too.]

3 Rationale for curviform–cuneiform disunification

TODO(egg): blurb.

3.1 The cuneiform encoding model

As outlined in, *e.g.*, [UTR56], the cuneiform encoding model is diachronic; each character may have wildly different glyphs depending on time period and region. For instance, the sign IM may resemble  in texts from Early Dynastic IIIa Šuruppag as in the character code charts,  later in the third millennium⁵,  in Old Babylonian cursive,  in Neo-Assyrian, but is always encoded as U+1214E CUNEIFORM SIGN IM.

This encoding model allows for the interoperable representation of editions of diachronic reference works such as sign lists⁶ and dictionaries⁷, and of composite texts⁸. By being compatible with similarly diachronic transliteration practice (that is, by avoiding distinctions finer than those made in transliteration), the encoding model also allows for automated conversion of transliterated corpora to cuneiform, which has proven useful as a processing step in analyses such as [Rom24; JJ24]⁹. The diachronic approach is also useful for pedagogical applications¹⁰.

3.2 Arguments for curviform–cuneiform unification

In this context, the argument was made in [Ando4], as part of discussion of the cuneiform encoding¹¹ that the curviform numerals, which occasionally appear in the Ur III period and are used heavily in the Early Dynastic period, were a stylistic distinction unifiable with the cuneiform digits, and that an archaizing Ur III font or an Early Dynastic font could have curviform glyphs for the appropriate characters.

Some co-occurrence of curviform and cuneiform digits was known and acknowledged. [Ando4, p. 3] cites [NDE93, p. 62], which is a copy of [P020054], an Early Dynastic IIIb administrative tablet from Nirsu. The excerpt cited, lines 1–3 of column 1 of the obverse, is as follows:

⁵Merging with U+1224E  NI₂.

⁶Notably [VT+14] and the online edition of [Bor10] in [Jim+23, Signs].

⁷Notably [TJV17] and the online edition of [Sch10] in [Jim+23, Dictionary].

⁸For example, there are Neo-Assyrian and Neo-Babylonian copies parts of the laws of , as well as Old Babylonian copies in both archaizing and cursive styles. Because of damage on the stele [P249253], some sections are known only from those copies. See [Oel22, pp. 110 sqq.].

⁹Attendees may recall the summary given on the third day of UTC #180, as recorded in [Con24]. Other readers may refer to [Svā+24, pp. 242, 148].

¹⁰For instance, Old Babylonian grammar may be taught in the Neo-Assyrian script, as in [Cap02].

¹¹At that time scoped to the repertoire of the Ur III period and later, see [EF03, p. 1], although many disunifications, such as  ≠ , were informed by Early Dynastic distinctions.

 ¹²						
1(NĖŠ ₂)	1(U)	1/2(DIŠ)	5(DIŠ <i>tenû</i>)	gi	us ₂	sa ₂

this field						

   
tug_x(LAK483)-si-ga-kam¹⁴
deep ploughing

The argument made in [Ando4, p. 4] is that this is comparable to a stylistic distinction such as¹⁵

465 metres, equal lengths
198 metres, equal widths
this field: 9, 18 hectares, deeply ploughed

where the numerals have the same structure ([Ando4] contrasts this to the different structures of ASCII digits and roman numerals). That document further claims that “the number signs do not normally carry in their individual signs the meaning of what they are used to measure”, and that curviform and cuneiform numerals “are not normally mixed together in a single numerical expression”, noting the exceptions of [P232278; P232280]. In addition, [Ando4, p. 4] points out that the cuneiform numeric signs are descended from the curviform ones (this is undisputed), and claims there is only a small re-allocation of the function of signs (from  to -numerals). It therefore comes to the conclusion that the use of curviform numerals should be seen as a formatting distinction, rather than one that should be represented in plain text, and insists that the encoding should capture the lineal historical descent of those signs, presumably to take advantage of the benefits of diachronic encoding described in section 3.1.

Although they had been part of the preliminary proposal [EFT03], the curviform numerals were therefore removed from [EFT04b] and [EFT04a], which both state that “The distinction between curved numerals and their cuneiform descendants is treated as glyphic for the purposes of the present proposal; this issue will need to be revisited in subsequent encoding phases.”

The time has come to revisit this issue. As we will see in section 3.3, numerals can only be interpreted in the context of what they measure *i.e.*, as part of a metrological system. In section 3.4 we will see that in some periods:

- the functions and use of the numerals vary beyond the mere / switch;

¹²As noted in [Pow87, p. 466], this sign has a very short “tail” in this period, so that it is wider than it is tall, and can at first seem like a large  in copies. The photos in CDLI clearly show that this is in fact a vertical wedge.

¹³Note that ED IIIb  numerals have a somewhat different appearance from those of the Ur III period used in this transcription; the sign  in [P020054] looks more like Ur III .

¹⁴Transliteration after [Lec20, p. 8].

¹⁵We have taken the liberty of adjusting the analogy to use measures approximately equal to those in [P020054], instead of a field of five by twenty-five metres.

- ### 3.3 Metrology

Edubha'ga D

As is well known¹⁶ a sexagesimal place value system (SPVS) was used in Mesopotamia from the late third millennium onwards. One should bear in mind, however, that other systems were used; the SPVS was primarily used in calculations, with results being expressed in non-positional systems [Robo8, p. 76; Rob22]. The digits 1–59 of the SPVS have inner structure which is reflected in the encoding: the digits 1–9 are the individual characters I – III , the multiples of ten (10–50) are < – X , but the other digits 11–59 are sequences < I – X III ; in effect the base-sixty digits are themselves written in base ten, with a different set of symbols for the tens place. This reflects the origin of the sexagesimal place value system; it derives from a *non-positional* system, hereafter the *cuneiform discrete counting system* $\mathcal{S}_{\text{Ur III/OB}}$, which had different signs for the units I – III , tens < – X , sixties I – X III (with larger wedges than the units), six hundreds I – X III , three thousand six hundreds I – X III I – X III , and thirty-six thousands I – X III I – X III I – X III .

$$\diamond \xleftarrow{10} \diamond \xleftarrow{6} \nmid \xleftarrow{10} \nmid \xleftarrow{6} \diamond \xleftarrow{10} \nmid \quad (S_{\text{Ur III/OB}})$$

¹⁷These diagrams, which have become standard in discussions of Mesopotamian metrology, originate with [Fri78, p. 10], where they are called *step-diagrams*.

This intertwining of units and numerals explains the large number of already-encoded numeral series:

- \mathbb{I} – \mathbb{W} used in $S_{\text{Ur III/OB}}$ and the SPVS as well as with overt units;
- \mathbb{L} – \mathbb{X} used in $G_{\text{Ur III/OB}}$, of which \mathbb{L} – \mathbb{X} are also used in $S_{\text{Ur III/OB}}$ and the SPVS as well as with overt units;
- \mathbb{Y} – \mathbb{Z} used in $S_{\text{Ur III/OB}}$, and sometimes with overt units;
- \mathbb{A} – \mathbb{K} used in $S_{\text{Ur III/OB}}$;
- \mathbb{D} – \mathbb{N} used in $S_{\text{Ur III/OB}}$ and $G_{\text{Ur III/OB}}$;
- \mathbb{O} – \mathbb{P} used in $S_{\text{Ur III/OB}}$ and $G_{\text{Ur III/OB}}$;
- \mathbb{Q} – \mathbb{R} used in $C_{\text{Ur III/OB}}$ as well as with overt units of the weight system;
- \mathbb{S} , \mathbb{T} , \mathbb{U} , \mathbb{V} , \mathbb{W} used in $C_{\text{Ur III/OB}}$;
- \mathbb{I} , \mathbb{J} , \mathbb{K} , \mathbb{L} used in $C_{\text{Ur III/OB}}$ —note the overlap with \mathbb{I} – \mathbb{W} ;
- \mathbb{M} and \mathbb{N} used in $G_{\text{Ur III/OB}}$.

3.4.2 Dyke lengths in Nirsu

[illegible]
$$\underbrace{\text{♩} \xleftarrow{2} \text{♩}}_{\text{♩}} \xleftarrow{10} \text{♩} \xleftarrow{6} \text{♩} \xleftarrow{3} \text{♩} \quad (L'_{ED IIIb})$$

$$\underbrace{\begin{array}{c} \textcircled{D} \xleftarrow{10} \textcircled{D} \xleftarrow{6} \bullet \xleftarrow{2} \textcircled{H} \textcircled{I} \end{array}}_{\textcircled{L}} \overset{34}{=} \textcircled{H} \textcircled{I} \xleftarrow{10} \textcircled{H} \textcircled{I}. \quad (L''_{ED IIIb})$$

9

The system of grain³⁵ capacities in Ebla uses the following units³⁶:

$$\begin{array}{ccccccc} \text{𐎗𐎗𐎕} \text{ } \overleftarrow{2} & \text{𐎗𐎗𐎕} \text{ } \overleftarrow{\frac{5}{2}} & \text{𐎗𐎗𐎕} \text{ } \overleftarrow{4} & \text{𐎗𐎗𐎕} \text{ } \overleftarrow{6} & & & \\ \text{gu}_2\text{-bar} & \text{ba-ri}_2\text{-zu} & \text{ḡin}_4 & \text{niḡ}_2\text{-sagšū} & \text{an-zam}_x & & \end{array}$$

The 𐎗𐎗𐎕 and 𐎗𐎗𐎕 are generally counted using curviform numerals, and the smaller units using cuneiform 𐎗 numerals. Indeed, a search on [Mil+07] for co-occurrences of 𐎗𐎗𐎕 with either of 𐎗𐎗𐎕 or 𐎗𐎗𐎕 finds the following expressions³⁷:

1. [P240532, verso 4, 9] 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕³⁹ 𐎗𐎗𐎕
2. [P240548, verso 1, 1] 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕
3. [P240655, recto 7, 9] 𐎗𐎗𐎕⁴⁰ 𐎗𐎗𐎕
4. [P240579, verso 4, 3] 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕
5. [P240675, verso 2, 2] 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕
6. [P240609, verso 3, 1] 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕
7. [P240533, recto 3, 3] 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕
8. [P240697, recto 1, 5] 𐎗𐎗𐎕⁴¹ 𐎗𐎗𐎕 𐎗𐎗𐎕
9. [P240653, recto 6, 2] 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕
10. [P240654, recto 2, 6] 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕⁴² 𐎗𐎗𐎕⁴³
11. [P240531, recto 1, 8] 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕
12. [P241708, recto 1, 1]⁴⁴ 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕
13. [P241904, recto 1, 1]⁴⁵ 𐎗𐎗𐎕⁴⁶ 𐎗𐎗𐎕

Note that higher numbers of 𐎗𐎗𐎕 are expressed in hundreds (*mi-at* 𐎗𐎗𐎕) and then thousands (*li-im* 𐎗𐎗𐎕), as is typical in Ebla [Arc15, p. 33], *e.g.*, in [P240532, verso 2, 3], 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕 (100 + 60 + 30 + 5 = 195 𐎗𐎗𐎕 of grain).

³⁵Liquid capacities use a different system [Arc15, p. 229 with note 12]:

$$\begin{array}{ccc} \text{𐎗𐎗𐎕} \text{ } \overleftarrow{30} & \text{𐎗} \text{ } \overleftarrow{6} & \text{𐎗𐎗𐎕} \\ \text{la-ḡa} & \text{silā}_3 & \text{an-zam}_x \end{array}$$

At a glance it seems that 𐎗 are counted with cuneiform numerals and higher units with curviform ones, thus

$$\begin{array}{c} \overbrace{\text{𐎗𐎗𐎕} \text{ } \overleftarrow{\frac{5}{3}} \text{ } \overleftarrow{6} \text{ } \overleftarrow{10}}^{\text{𐎗𐎗𐎕}} \text{ } \overleftarrow{3} \text{ } \overleftarrow{\frac{10}{3}} \text{ } \overleftarrow{6} \text{ } \text{𐎗𐎗𐎕} \\ \text{𐎗} \end{array}$$

but we have not investigated this thoroughly.

³⁶TODO mention the other one citing Chambon and the footnote in Archi

³⁷We cite here only one attestation per tablet; most tablets contain several expressions mixing curviform 𐎗𐎗𐎕 and larger with cuneiform 𐎗 and smaller. In all cases the transcriptions given here are based on the EbDA transliterations, but the shape and orientation of the numerals was checked³⁸ on a photograph (from EbDA unless noted otherwise).

³⁸As we will see in Section 3.6.1, CDLI transliterations indicate numeral shape; however, as of this writing, they do so incorrectly on the Ebla corpus, claiming that all numerals are curviform, so we were not able to rely on them in this specific case.

³⁹ba-ri₂-zu₂, a variant spelling.

⁴⁰Short for 𐎗𐎗𐎕.

⁴¹Note the omitted 𐎗𐎗𐎕.

⁴²Instead of the expected 𐎗𐎗𐎕.

⁴³𐎗𐎗𐎕 not legible on the EbDA photo.

⁴⁴From CDLI photo.

⁴⁵From photo in [Arc89, p. 6].

⁴⁶Laid out as 𐎗𐎗𐎕; on stacking patterns see Section 6.2.

formed by only two signs Υ and \angle , repeated as many times as necessary; this type of notation is highly standardized. Second, the order of magnitude of the numbers noted in this system is not indicated: 1, 60, 60², 60³, 1/60, 1/60², etc. are written in the same way, with the vertical wedge Υ . The third feature concerns the exact function of

Figure 4: TODO [Cha12, p. 58]

one step. The scribes of the Early Dynastic Period (c. 2600 BC), for instance, represented the number 648,000 with: $\Upsilon\Upsilon\Upsilon\bullet\bullet\bullet$ but never with the repetition $\Upsilon\Upsilon\Upsilon\Upsilon\Upsilon\Upsilon$.

Figure 5: TODO [Cha12, p. 59]⁴⁹

repetition of the same sign refers to both the capacity unit signified—often but not necessarily written immediately afterwards—and its value. The units of measurement are written in descending order from left to right—just as we would write 3 km, 120 m, 50 cm. For example:

$\Upsilon\Upsilon\Upsilon$ še bar Υ ba-rí-zu
 ‘3 gubar (capacity units) and 1 parisu’.

Figure 6: TODO [Cha12, p. 61]

This is particularly true of the signs Υ , $\Upsilon\Upsilon$, $\Upsilon\Upsilon\Upsilon$ and $\Upsilon\Upsilon\Upsilon\Upsilon$, whose form explicitly denotes the fractions 1/6, 2/6, 3/6, and 4/6 of the barig capacity measure written Υ in Mesopotamia—also transcribed by Assyriologists as 1 bán, 2 bán, 3 bán, and 4 bán with reference to the bán measure worth 1/6 of the barig. At Ebla, the sign Υ is most often associated with the parisu measure, while the signs Υ , $\Upsilon\Upsilon$, $\Upsilon\Upsilon\Upsilon$ and $\Upsilon\Upsilon\Upsilon\Upsilon$ refer to 1, 2, 3,

Figure 7: TODO [Cha12, p. 64]

shape. The principle of notation is additive: each sign is noted as many times as necessary (e.g., $\Upsilon\Upsilon\Upsilon\Upsilon\Upsilon\Upsilon$ transliterated as 2(šar₂) 1(geš₂u) 3(u), means 2 × 3600 + 1 × 600 + 3 × 10). The system is based on an alternation of factors ten and

Figure 8: TODO

might think of one fabric and a half,¹¹ but the presence of notations with “2 Υ 2 Υ ”, “3 Υ 3 Υ ”, and “6 Υ 6 Υ ” (Fig. 1) elements excludes that one deals with fractions, as these notations are not consistent with those of Šuruppag’s weight measurement system.¹² The notation “1 Υ gada” in o. ii 1 and r. vi 1, along with the total of “39
