## 1 Summary

This document proposes encoding some numerals used in the Uruk and Early Dynastic periods in conjunction with the Sumero-Akkadian cuneiform script<sup>1</sup> and the proto-cuneiform script<sup>2</sup>. The proposed characters are listed in section 2.

The non-numeric signs of proto-cuneiform will be the subject of a separate proposal; we need only note here that the divergence between the approaches to character identity in modern scholarship requires that proto-cuneiform be disunified from cuneiform: proto-cuneiform is effectively treated as an undeciphered script. In contrast, the cuneiform encoding model is semantic, requiring an understanding of the text to correctly encode it.

However, the *numerals* used in proto-cuneiform should be unified with ones used in the Early Dynastic period, for the reasons set forth in section 4. The proposed “curved”, or “curviform”, numerals<sup>3</sup> should however *not* be unified with the already-encoded cuneiform numerals<sup>4</sup>. Since the encoding proposals for the cuneiform script twenty years ago provisionally considered the curviform numerals to be glyph variants of the cuneiform numerals, a detailed rationale is provided in section 3, including compatibility considerations in section 3.7.

The overall picture of unifications and disunifications over time is illustrated in table 1. The Script\_Extensions property assignments in section 2.2 reflect the overlap.

TODO(egg): blurb.

### 3.1 The cuneiform encoding model

As outlined in, *e.g.*, [UTR56], the cuneiform encoding model is diachronic; each character may have wildly different glyphs depending on time period and region. For instance, the sign IM may resemble  in texts from Early Dynastic IIIa Suruppag as in the character code charts,  later in the third millennium<sup>5</sup>,  in Old Babylonian cursive,  in Neo-Assyrian, but is always encoded as U+1214E CUNEIFORM SIGN IM.

This encoding model allows for the interoperable representation of editions of diachronic reference works such as sign lists<sup>6</sup> and dictionaries<sup>7</sup>, and of composite texts<sup>8</sup>. By being compatible with similarly diachronic transliteration practice (that is, by avoiding distinctions finer than those made in transliteration), the encoding model also allows for automated conversion of transliterated corpora to cuneiform, which has proven useful as a processing step in analyses such as [Rom24; JJ24]<sup>9</sup>. The diachronic approach is also useful for pedagogical applications<sup>10</sup>.

### 3.2 Arguments for curviform–cuneiform unification

In this context, the argument was made in [L2/04-099], as part of discussion of the cuneiform encoding<sup>11</sup> that the curviform numerals, which occasionally appear in the Ur III period and are used heavily in the Early Dynastic period, were a stylistic distinction unifiable with the cuneiform digits, and that an archaizing Ur III font or an Early Dynastic font could have curviform glyphs for the appropriate characters.

Some co-occurrence of curviform and cuneiform digits was known and acknowledged. [L2/04-099, p. 3] cites [NDE93, p. 62], which is a copy of [P020054], an

<sup>6</sup>Notably [VT+14] and the online edition of [Bor10] in [Jim+23, Signs].

<sup>7</sup>Notably [TJV17] and the online edition of [Sch10] in [Jim+23, Dictionary].

<sup>8</sup>For example, there are Neo-Assyrian and Neo-Babylonian copies parts of the laws of , as well as Old Babylonian copies in both archaizing and cursive styles. Because of damage on the stele [P249253], some sections are known only from those copies. See [Oel22, pp. 110 sqq.].

<sup>9</sup>Attendees may recall the summary given on the third day of UTC #180, as recorded in [L2/24-159]. Other readers may refer to [Svā+24, pp. 242, 148].

<sup>10</sup>For instance, Old Babylonian grammar may be taught in the Neo-Assyrian script, as in [Cap02].

<sup>11</sup>At that time scoped to the repertoire of the Ur III period and later, see [L2/03-162, p. 1], although many disunifications, such as  ≠ , were informed by Early Dynastic distinctions.

Early Dynastic IIIb administrative tablet from Nirsu. The excerpt cited, lines 1–3 of column 1 of the obverse, is as follows:

 <sup>12</sup>						
1(NEŠ <sub>2</sub> )	1(U)	1/2(DIŠ)	5(DIŠ <i>tenû</i> )	gi	us <sub>2</sub>	sa <sub>2</sub>
	7.5 (ropes)		5	reed	side	equal

this field						

     
tug<sub>x</sub>(LAK483)-si-ga-kam<sup>14</sup>

The argument made in [L2/04-099, p. 4] is that this is comparable to a stylistic distinction such as<sup>15</sup>

465 metres, equal lengths  
198 metres, equal widths  
this field: 9, 18 hectares, deeply ploughed

where the numerals have the same structure ([L2/04-099] contrasts this to the different structures of ASCII digits and roman numerals). That document further claims that “the number signs do not normally carry in their individual signs the meaning of what they are used to measure”, and that curviform and cuneiform numerals “are not normally mixed together in a single numerical expression”, noting the exceptions of [P232278; P232280]. In addition, [L2/04-099, p. 4] points out that the cuneiform numeric signs are descended from the curviform ones (this is undisputed), and claims there is only a small re-allocation of the function of signs (from - to -numerals). It therefore comes to the conclusion that the use of curviform numerals should be seen as a formatting distinction, rather than one that should be represented in plain text, and insists that the encoding should capture the lineal historical descent of those signs, presumably to take advantage of the benefits of diachronic encoding described in section 3.1.

Although they had been part of the preliminary proposal [L2/03-393R], the curviform numerals were therefore removed from [L2/04-036] and [L2/04-189], which both state that “The distinction between curved numerals and their cuneiform descendants is treated as glyphic for the purposes of the present proposal; this issue will need to be revisited in subsequent encoding phases.”

The time has come to revisit this issue. As we will see in section 3.3, numerals can only be interpreted in the context of what they measure *i.e.*, as part of a metrological system. In section 3.4 we will see that in some periods:

<sup>12</sup>As noted in [Pow87, p. 466], this sign has a very short “tail” in this period, so that it is wider than it is tall, and can at first seem like a large  in copies. The photos in CDLI clearly show that this is in fact a vertical wedge.

<sup>13</sup>Note that ED IIIb  numerals have a somewhat different appearance from those of the Ur III period used in this transcription; the sign  in [P020054] looks more like Ur III .

<sup>14</sup>Transliteration after [Lec20, p. 8].

<sup>15</sup>We have taken the liberty of adjusting the analogy to use measures approximately equal to those in [P020054], instead of a field of five by twenty-five metres.

- the functions and use of the numerals vary beyond the mere  $\nabla$ / $\intercal$  switch;
- the contrast between curviform and cuneiform numerals is commonly used to distinguish metrological systems;
- some metrological systems commonly mix curviform and cuneiform in single numerical expressions.

*Edubba'a D*

Before diving into the usage of the curviform numerals in the Early Dynastic period to explain the contrast with cuneiform numerals, it is useful to understand the usage of the already-encoded characters in the Ur III and Old Babylonian periods.

As is well known<sup>16</sup> a sexagesimal place value system (SPVS) was used in Mesopotamia from the late third millennium onwards. One should bear in mind, however, that other systems were used; the SPVS was primarily used in calculations, with results being expressed in non-positional systems [Robo8, p. 76; Rob22]. The digits 1–59 of the SPVS have inner structure which is reflected in the encoding: the digits 1–9 are the individual characters  $\intercal$ – $\text{𒌷}$ , the multiples of ten (10–50) are  $\leftarrow$ – $\text{𒌷}$ , but the other digits 11–59 are sequences  $\leftarrow$  $\intercal$ – $\text{𒌷}$ ; in effect the base-sixty digits are themselves written in base ten, with a different set of symbols for the tens place. This reflects the origin of the sexagesimal place value system; it derives from a *non-positional* system, hereafter the *cuneiform discrete counting system*  $S_{\text{Ur III/OB}}$ , which had different signs for the units  $\intercal$ – $\text{𒌷}$ , tens  $\leftarrow$ – $\text{𒌷}$ , sixties  $\text{𒌷}$ – $\text{𒌷}$  (with larger wedges than the units), six hundreds  $\text{𒌷}$ – $\text{𒌷}$ , three thousand six hundreds  $\text{𒌷}$ – $\text{𒌷}$ , and thirty-six thousands  $\text{𒌷}$ – $\text{𒌷}$ .

#### 3.3.1 The discrete counting system

The relations between the values of the signs in the cuneiform discrete counting system may be summarized by the following factor diagram<sup>17</sup>, where the number over arrow indicates the multiple of the preceding sign (right of the arrow) corresponding to the following sign (left).

$$\text{𒌷} \xleftarrow{10} \text{𒌷} \xleftarrow{6} \text{𒌷} \xleftarrow{10} \intercal \xleftarrow{6} \leftarrow \xleftarrow{10} \intercal \quad (S_{\text{Ur III/OB}})$$

For example, the number  $1729 = ((2 \times 10 + 8) \times 6 + 4) \times 10 + 9 = 28 \times 60 + 49$  would be written  $\text{𒌷} \text{𒌷} \text{𒌷} \text{𒌷} \text{𒌷}$  in the discrete counting system, and  $\text{𒌷} \text{𒌷} \text{𒌷} \text{𒌷}$  in the sexagesimal place value system.

<sup>16</sup>See, e.g., [Uni16, §22.3.3, sub “Cuneiform Numerals”].

<sup>17</sup>These diagrams, which have become standard in discussions of Mesopotamian metrology, originate with [Fri78, p. 10], where they are called *step-diagrams*.

Observe that while large numbers of gur follow<sup>23</sup> system  $S_{Ur\ III/OB}$ , the use of horizontal (AŠ) numerals for the gur disambiguates from the vertical bariga, as  $\langle \text{I} \text{AŠ} \rangle$  would be 10 gur 1 bariga, and  $\langle \text{—} \text{AŠ} \rangle$  would be 11 gur; again even with some overt units, most of the numerals that participate in a metrological system have an interpretation dependent on that system.

This intertwining of units and numerals explains the large number of already-encoded numeral series:

- $\text{I} \text{—} \text{AŠ}$  used in  $S_{Ur\ III/OB}$  and the SPVS as well as with overt units;
- $\langle \text{—} \text{AŠ} \rangle$  used in  $G_{Ur\ III/OB}$ , of which  $\langle \text{—} \text{AŠ} \rangle$  are also used in  $S_{Ur\ III/OB}$  and the SPVS as well as with overt units;
- $\text{I} \text{—} \text{AŠ}$  used in  $S_{Ur\ III/OB}$ , and sometimes with overt units;
- $\text{I} \text{—} \text{AŠ}$  used in  $S_{Ur\ III/OB}$ ;
- $\text{I} \text{—} \text{AŠ}$  used in  $S_{Ur\ III/OB}$  and  $G_{Ur\ III/OB}$ ;
- $\text{I} \text{—} \text{AŠ}$  used in  $S_{Ur\ III/OB}$  and  $G_{Ur\ III/OB}$ ;
- $\text{I} \text{—} \text{AŠ}$  used in  $C_{Ur\ III/OB}$  as well as with overt units of the weight system;
- $\text{I} \text{—} \text{AŠ}$ ,  $\text{I} \text{—} \text{AŠ}$ ,  $\text{I} \text{—} \text{AŠ}$ ,  $\text{I} \text{—} \text{AŠ}$ ,  $\text{I} \text{—} \text{AŠ}$  used in  $C_{Ur\ III/OB}$ ;
- $\text{I}$ ,  $\text{I}$ ,  $\text{I}$ ,  $\text{I}$  used in  $C_{Ur\ III/OB}$ —note the overlap with  $\text{I} \text{—} \text{AŠ}$ ;
- $\text{I}$  and  $\text{I}$  used in  $G_{Ur\ III/OB}$ .

Only in the SPVS did numerals exist truly independently of metrology; to quote [Rob08, p. 78]: “The SPVS temporarily changed the status of numbers from properties of real-world objects to independent entities that could be manipulated without regard to [...] metrological system. [...] Once the calculation was done, the result was expressed in the most appropriate metrological units and thus re-entered the natural world as a concrete quantity.”

### 3.3.4 The length system

In the Ur III and Old Babylonian periods, lengths are expressed using overt units counted with  $\text{I}$ - and  $\langle \text{—} \rangle$ -numerals with their system  $S_{Ur\ III/OB}$  values<sup>24</sup>. Since it does not have any unusual numerals, this system would not in itself be of much relevance to character encoding, but we present it here as background for its Early Dynastic counterpart presented in section 3.4. Metrological tables use the following units [Fri07, p. 118; Rob19]:

$\text{I} \text{—} \text{AŠ}$	$\xleftarrow{60}$	$\text{I} \text{—} \text{AŠ}$	$\xleftarrow{10}$	$\text{I} \text{—} \text{AŠ}$	$\xleftarrow{12}$	$\text{I} \text{—} \text{AŠ}$	$\xleftarrow{30}$	$\text{I} \text{—} \text{AŠ}$		$(L_{Ur\ III/OB})$
danna		US <sup>25</sup>		nindan		kuš <sub>3</sub>		šu-si		
bērum		cable		nindanum		ammatum		ubānum		
league		360 m		rod		cubit		finger		
10,8 km				6 m		50 cm		17 mm		

Two more units appear occasionally [Pow87, p. 459; Fri07, p. 118; Rob19]:

$\text{I} \text{—} \text{AŠ}$	$\xleftarrow{30}$	$\text{I} \text{—} \text{AŠ}$	$\xleftarrow{6}$	$\text{I} \text{—} \text{AŠ}$	$\xleftarrow{10}$	$\text{I} \text{—} \text{AŠ}$	$\xleftarrow{2}$	$\text{I} \text{—} \text{AŠ}$	$\xleftarrow{6}$	$\text{I} \text{—} \text{AŠ}$	$\xleftarrow{30}$	$\text{I} \text{—} \text{AŠ}$		$(\bar{L}_{Ur\ III/OB})$
			eše <sub>2</sub>				gi							
			ašlum				qānum							
			rope				reed							
			60 m				3 m							

<sup>22</sup>From [P309594].

<sup>23</sup>A larger unit, the guru<sub>7</sub> (karûm, grain heap), is sometimes used instead, with  $\text{—} \text{AŠ} \text{—} \text{AŠ} \text{—} \text{AŠ} \text{—} \text{AŠ} \text{—} \text{AŠ} \text{—} \text{AŠ}$  (1 karûm = 3600 kurrû). See [Fri07, p. 415; Rob19].

<sup>24</sup>Adjacent units are no more than a factor of 60 apart, so higher numerals such as  $\text{I}$  or  $\text{I}$  are not used.

The 𐎗𐎗𐎕 and 𐎗𐎗𐎕 are generally counted using curviform numerals, and the smaller units using cuneiform 𐎗 numerals. Indeed, a search on [Mil+07] for co-occurrences of 𐎗𐎗𐎕 with either of 𐎗𐎗𐎕 or 𐎗𐎗𐎕 finds the following expressions<sup>38</sup>:

Note that higher numbers of 𐎗𐎗𐎕 are expressed in hundreds (*mi-at* 𐎗𐎗𐎕) and then thousands (*li-im* 𐎗𐎗𐎕), as is typical in Ebla [Arc15, p. 33], *e.g.*, in [P240532, verso 2, 3], 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕 𐎗𐎗𐎕 (100 + 60 + 30 + 5 = 195 𐎗𐎗𐎕 of grain).

<sup>36</sup>Liquid capacities use a different system [Arc15, p. 229 with note 12]:

$$\begin{array}{ccc} \text{𐎗𐎗𐎕} & \xleftarrow{30} & \text{𐎗} & \xleftarrow{6} & \text{𐎗𐎗𐎕} \\ \text{la-ḡa} & & \text{sila}_3 & & \text{an-zam}_x \end{array}$$

At a glance it seems that 𐎗 are counted with cuneiform numerals and higher units with curviform ones, thus

$$\text{𐎗𐎗𐎕} \xleftarrow{\frac{5}{3}} \text{𐎗} \xleftarrow{6} \text{𐎗} \xleftarrow{10} \text{𐎗} \xleftarrow{3} \text{𐎗} \xleftarrow{10} \text{𐎗} \xleftarrow{6} \text{𐎗𐎗𐎕},$$

but we have not investigated this thoroughly.

<sup>37</sup>TODO mention the other one citing Chambon and the footnote in Archi

<sup>38</sup>We cite here only one attestation per tablet; most tablets contain several expressions mixing curviform 𐎗𐎗𐎕 and larger with cuneiform 𐎗 and smaller. In all cases the transcriptions given here are based on the EbDA transliterations, but the shape and orientation of the numerals was checked<sup>39</sup> on a photograph (from EbDA unless noted otherwise).

<sup>39</sup>As we will see in Section 3.6.1, CDLI transliterations indicate numeral shape; however, as of this writing, they do so incorrectly on the Ebla corpus, claiming that all numerals are curviform, so we were not able to rely on them in this specific case.

formed by only two signs  $\Uparrow$  and  $\lhd$ , repeated as many times as necessary; this type of notation is highly standardized. Second, the order of magnitude of the numbers noted in this system is not indicated:  $1, 6, 6^2, 6^3, 1/6, 1/6^2$ , etc. are written in the same way, with the vertical wedge  $\Uparrow$ . repetition of the same sign refers to both the capacity unit signified—often but not necessarily written immediately afterwards—and its value. The units of measurement are written in descending order from left to right—just as we would write 3 km, 120 m, 50 cm. For example:

☞☞☞ še bar ☞ *ba-rí-zu*

'3 *gubar* (capacity units) and 1 *parīsu*'.

Figure 6: TODO [Cha12, p. 61]

This is particularly true of the signs , ,  and , whose form explicitly denotes the fractions 1/6, 2/6, 3/6, and 4/6 of the barig capacity measure written  in Mesopotamia—also transcribed by Assyriologists as 1 bān, 2 bān, 3 bān, and 4 bān with reference to the bān measure worth 1/6 of the barig. At Ebla, the sign  is most often associated with the *parisu* measure, while the signs , ,  and  refer to 1, 2, 3,

shape. The principle of notation is additive: each sign is noted as many times as necessary (e.g.,  transliterated as 2(šar<sub>2</sub>) 1(geš'u) 3(u), means  $2 \times 3600 + 1 \times 600 + 3 \times 10$ ). The system is based on an alternation of factors ten and

might think of one fabric and a half,<sup>11</sup> but the presence of notations with “2D 2U”, “3D 3U”, and “6D 6U” (Fig. 1) elements excludes that one deals with fractions, as these notations are not consistent with those of Šuruppag’s weight measurement system.<sup>12</sup> The notation “1D gada” in o. ii 1 and r. vi 1, along with the total of “39

### 3.6 Limited benefits of diachronic encoding for numerals

[TODO Composite texts dating back to the period where curved numerals are in use tend to be limited to lexical texts, which do not usually have numbers. When they do, diachronic encoding is prevented by diš-aš distinctions anyway. Administrative texts, which are where numbers are most prominent, are not composite.]

[TODO Diachronic reference works tend to not include numbers, or when they do, to treat them specially (for instance, they are shown at the end of sign lists such as TODO).]

[TODO The overarching goal of having consistent representation for equivalent numeric expressions from different periods is quickly foiled by changes in metrology.]

Note that in [Rom24] [TODO(egg): Cite the GitHub repository], as in many other such analyses, numbers are removed as an early step in processing; these therefore would not benefit from diachrony in the encoding of numeric expressions.

#### 3.6.1 Compatibility with transliteration

TODO words [Rob08, p. 295] TODO cite [Molina2014]

### 3.7 Compatibility considerations

A disunification twenty years after the fact, affecting all numerals, would ordinarily be a serious compatibility issue. Fortunately, with one exception discussed below, we are not aware of any font using curviform glyphs for the already-encoded numerals. In fact we are not aware of any font designed for a style earlier than Old Babylonian, except for fonts mimicking the representative glyphs from the code charts, which are primarily Ur III, but sometimes earlier or later, as described in [UTR56, §2.4]. The lack of dedicated Ur III fonts may be explainable by the chart-like fonts<sup>54</sup> being good enough; the lack of Early Dynastic fonts, by the aforementioned issues with numeral identification making the representation of any text with numerals intractable.

#### 3.7.1 The case of ŠAR<sub>2</sub>

[TODO explain why this isn't a problem, effectively anyone who needs to cuneify 1(ŠAR<sub>2</sub><sup>c</sup>) will also need to cuneify some of the numerals proposed here and will therefore not be using Unicode cuneiform.] [TODO U+122B9 CUNEIFORM SIGN SHAR2 represents both 1(ŠAR<sub>2</sub>) and non-numeric šar<sub>2</sub>; it looks like ◊ (so, like ◊) in all but lexical texts from Ebla and Šuruppak (and the archaizing vulture stele, where note that the scribe slipped into his modern ways once), where it looks like (TODO: the proposed character). The proposed character is to be used for 1(ŠAR<sub>2</sub><sup>c</sup>). 1(ŠAR<sub>2</sub>) does not exist back when non-numeric šar<sub>2</sub> is curviform, so it works out.]

### 6.1 Missing numerals

(N<sub>17</sub>, 12N<sub>14</sub>, etc.) 7(diš *tenû*)

### 6.2 Stacking patterns

(... are a mess, vary within Uruk, and are not transliterated/documented by Englund, so let's not go there for now.)

### 6.3 Matters for higher-level protocols
