1 Summary

This document proposes encoding some numerals used in the fourth millennium (Uruk IV and Uruk III) and Early Dynastic period in conjunction with the Sumero-Akkadian cuneiform script¹ and the proto-cuneiform script². The proposed characters are listed in §2. Most of them were listed in [L2/23-190]; however, the present document provides a more detailed rationale for their encoding and additional information about their identity.

The non-numeric signs of proto-cuneiform will be the subject of a separate proposal; we need only note here that the divergence between the approaches to character identity in modern scholarship requires that proto-cuneiform be disunified from cuneiform: proto-cuneiform is effectively treated as an undeciphered script. In contrast, the cuneiform encoding model is semantic, requiring an understanding of the text to correctly encode it.

However, the *numerals* used in proto-cuneiform should be unified with ones used in the Early Dynastic period, for the reasons set forth in §4. The proposed “curved”, or “curviform”, numerals³ should however *not* be unified with the already-encoded cuneiform numerals⁴. Since the encoding proposals for the cuneiform script twenty years ago provisionally considered the curviform numerals to be glyph variants of the cuneiform numerals, a detailed rationale is provided in §3, including compatibility considerations in section 3.7.

The overall picture of unifications and disunifications over time is illustrated in table 1. The Script_Extensions property assignments in §2.2 reflect the overlap. Many of these numerals are also used in proto-Elamite⁵ texts, where they are treated as identical characters in scholarship on proto-Elamite, so that they should

¹ISO 15924: Xsux, Script property value long name: Cuneiform; encoded since Unicode Version 5.0.

²ISO 15924: Pcun, not yet encoded.

³Impressed into clay using cylindrical styli, held either perpendicular to the tablet, yielding • (small stylus) or ● (large stylus), or at a shallower angle: ◻, ◻ (small stylus), ◻ (large stylus). Some numerals are composed of multiple such impressions, e.g., ◻◻. The terms “curved”, “curviform”, and “round” can be found in the literature. We avoid the term “round” here as it has other meanings in the context of numbers. We use “curviform” in this document as, being the least common term, it is least likely to lead to confusion, and “CURVED” in the character names for consistency with documentation about the modifier @c used in machine readable ATF transliterations [inlineATF].

⁴Impressed into clay using a stylus with a trihedral end: ┐ (stylus held horizontally), ↑ (vertically), ↘ (diagonally) < (with the head of the stylus), ↑ (stylus pressed deeper, forming a larger wedge), ⚡ (combining ↑ and <), etc.

⁵ISO 15924: Pelm, not yet encoded.

be unified with the ones proposed in [L2/23-196]. However, in the interest of time, we do not provide a detailed rationale for this unification in this document, and we are not proposing that the numerals be given the corresponding Script_Extensions property value for now. Neither do we propose encoding any numerals that are solely attested in proto-Elamite texts, or well-attested in proto-Elamite texts but insufficiently attested in Uruk.

[TODO(egg): Mention the other sections here too.]

2 Proposed changes to the Standard

2.1 Summary of proposed characters

2.2 Properties

2.3 Character names list

2.4 Core specification text

Amend [Uni16, §24.1.2, sub “Dashed Box Convention”], third paragraph, as follows:

In a few cases of very wide ~~punctuation~~ characters that do not naturally fit into a code chart cell, the representative glyph may be shown with an artificially narrow shape, displayed inside the dashed box, with or without additional annotation, to indicate this adjustment of shape.

3 Rationale for curviform–cuneiform disunification

The numbering systems that use cuneiform numerals are descended from the ones that use curviform numerals, and many of the cuneiform signs have clear curviform counterparts across this transition. Co-occurrences are sometimes described by analogy to distinctions that are not the realm of plain text, as in [Pow72, p. 215] “in the same fashion as we use black and red ink”; however, we must bear in mind that such analogies are not made in the context of character encoding discussions. In 2004, the curviform numerals were deemed unencodable for the time being; however, closer inspection reveals that the distinction functions less like markup than was argued at the time, and that the unification is problematic.

3.1 The cuneiform encoding model

As outlined in, *e.g.*, [UTR56], the cuneiform encoding model is diachronic; each character may have wildly different glyphs depending on time period and region. For instance, the sign IM may resemble  in texts from Early Dynastic IIIa Šuruppag as in the character code charts,  later in the third millennium⁶,  in Old Babylonian cursive,  in Neo-Assyrian, but is always encoded as U+1214E CUNEIFORM SIGN IM.

This encoding model allows for the interoperable representation of editions of diachronic reference works such as sign lists⁷ and dictionaries⁸, and of composite texts⁹. By being compatible with similarly diachronic transliteration practice, *i.e.*, by avoiding distinctions finer than those made in transliteration, the encoding model also allows for automated conversion of transliterated corpora to cuneiform, which has proven useful as a processing step in analyses such as [Rom24; JJ24]¹⁰. The diachronic approach is also useful for pedagogic applications¹¹.

3.2 Arguments for curviform–cuneiform unification

In this context, the argument was made in [L2/04-099], as part of discussion of the cuneiform encoding¹² that the curviform numerals, which occasionally appear in the Ur III period and are used heavily in the Early Dynastic period, were a stylistic distinction unifiable with the cuneiform digits, and that an archaizing Ur III font or an Early Dynastic font could have curviform glyphs for the appropriate characters.

Some co-occurrence of curviform and cuneiform digits was known and acknowledged. [L2/04-099, p. 3] cites [NDE93, p. 62], which is a copy of [P020054], an Early Dynastic IIIb administrative tablet from Nirsu. The excerpt cited, lines 1–3 of column 1 of the obverse, is as follows:

 ¹³						
1(ḫeš ₂)	1(u)	1/2(diš)	5(diš <i>tenû</i>)	gi	us ₂	sa ₂
	7.5 (ropes)		5	reed	side	equal
 ¹⁴						
3(u)	6(diš <i>tenû</i>)	gi	saṇ	sa ₂		
3 (ropes)	6	reed	front	equal		

⁶Merging with U+1224E CUNEIFORM SIGN NI2.

⁷Notably [OSL] and the online edition of [Bor10] in [eBL, Signs].

⁸Notably [ePSD2] and the online edition of [Sch10] in [eBL, Dictionary].

⁹For example, there are Neo-Assyrian and Neo-Babylonian copies parts of the laws of                         

¹⁰Attendees may recall the summary given on the third day of UTC #180, as recorded in [L2/24-159]. Other readers may refer to [Svā+24, pp. 242, 148].

¹¹For instance, Old Babylonian grammar may be taught in the Neo-Assyrian script, as in [Cap02].

¹²At that time scoped to the répertoire of the Ur III period and later, see [L2/03-162, p. 1], although many disunifications, such as  ≠ , were informed by Early Dynastic distinctions.

¹³As noted in [Pow87, p. 466], this sign has a very short “tail” in this period, so that it is wider than it is tall, and can at first seem like a large — in copies. The photos in [CDLI] clearly show that this is in fact a vertical wedge.

ašag=bi
ašag=bi
field=DEM¹⁵

1(bur₃) 1(eše₃) 1(iku) 1/2(iku)

tug_x(LAK483)-si-ga-kam
tugsiga =ak =am -Ø
ploughed=GEN=COP-3.SG.S

The argument made in [L2/04-099, p. 4] is that this is comparable to a stylistic distinction such as¹⁶

465 metres, equal lengths
198 metres, equal widths
this field is 9, 18 hectares of ploughed land

where the numerals have the same structure ([L2/04-099] contrasts this to the different structures of ASCII digits and roman numerals). That document further claims that “the number signs do not normally carry in their individual signs the meaning of what they are used to measure”, and that curviform and cuneiform numerals “are not normally mixed together in a single numerical expression”, noting the exceptions of [P232278; P232280]. In addition, [L2/04-099, p. 4] points out that the cuneiform numeric signs are descended from the curviform ones (this is undisputed), and claims there is only a small re-allocation of the function of signs (from  to  numerals). It therefore comes to the conclusion that the use of curviform numerals should be seen as a formatting distinction, rather than one that should be represented in plain text, and insists that the encoding should capture the lineal historical descent of those signs, presumably to take advantage of the benefits of diachronic encoding described in §3.1.

Although they had been part of the preliminary proposal [L2/03-393R], the curviform numerals were therefore removed from [L2/04-036] and [L2/04-189], which both state that “The distinction between curved numerals and their cuneiform descendants is treated as glyphic for the purposes of the present proposal; this issue will need to be revisited in subsequent encoding phases¹⁷.”

The time has come to revisit this issue. As we will see in §3.3, numerals can only be interpreted in the context of what they measure, *i.e.*, as part of a metrological system. In §3.4 we will see that in some periods:

- the functions and use of the numerals vary beyond the mere / switch;
- the contrast between curviform and cuneiform numerals is commonly used to distinguish metrological systems;

¹⁴Note that ED IIIb  numerals have a somewhat different appearance from those of the Ur III period used in this transcription; the sign  in [P020054] looks more like Ur III .

¹⁵Alternatively: area=POSS.3.SG.NH, “its area”.

¹⁶We have taken the liberty of adjusting the analogy to use measures approximately equal to those in [P020054], instead of a field of five by twenty-five metres.

¹⁷The cuneiform encoding process was planned in *stages* in [L2/03-162]. One might expect the second stage of encoding, which led to the creation of the Early Dynastic Cuneiform block, to incorporate the numerals needed for the representation and discussion of Early Dynastic texts; however, the proposal [L2/12-208] stated that “numerals have been omitted due to the complexity of numeral signs from this period. An expert in the metrology of this period must be consulted before these can be properly included.”

- some metrological systems commonly mix curviform and cuneiform in single numerical expressions.

3.3 A primer on classic Ur III and Old Babylonian metrologies

 I want to write tablets: the tablet of
 1 cor of barley to 600 cor; the tablet
 of 1 shekel of silver to 10 minas [...]
 Edubba'a D

Before diving into the usage of the curviform numerals in the Early Dynastic period to explain the contrast with cuneiform numerals, it is useful to understand the usage of the already-encoded characters in the Ur III and Old Babylonian periods.

As is well known¹⁸ a sexagesimal place value system (SPVS) was used in Mesopotamia from the late third millenium onwards. One should bear in mind, however, that other systems were used; the SPVS was primarily used in calculations, with results being expressed in non-positional systems [Rob08, p. 76; Rob22]. The digits 1–59 of the SPVS have inner structure which is reflected in the encoding: the digits 1–9 are the individual characters I – IIIIII , the multiples of ten (10–50) are < – <IIIIII , but the other digits 11–59 are sequences <I – <IIIIII ; in effect the base-sixty digits are themselves written in base ten, with a different set of symbols for the tens place. This reflects the origin of the sexagesimal place value system; it derives from a *non-positional* system, hereafter the *cuneiform discrete counting system* $S_{\text{Ur III/OB}}$, which had different signs for the units I – IIIIII , tens < – <IIIIII , sixties I – IIIIII (with larger wedges than the units), multiples of six hundred K – KIIIIII , multiples of three thousand six hundred D – DIIIIII , and multiples of thirty-six thousand D – DIIIIII .

3.3.1 The discrete counting system

The relations between the values of the signs in the cuneiform discrete counting system may be summarized by the following factor diagram¹⁹, where the number over arrow indicates the multiple of the preceding sign (right of the arrow) corresponding to the following sign (left).

$$\text{D} \xleftarrow{10} \text{D} \xleftarrow{6} \text{K} \xleftarrow{10} \text{I} \xleftarrow{6} \text{<} \xleftarrow{10} \text{I} \quad (S_{\text{Ur III/OB}})$$

For example, the number $1729 = ((2 \times 10 + 8) \times 6 + 4) \times 10 + 9 = 28 \times 60 + 49$ would be written $\text{KIIIIII} \text{IIIIII} \text{IIIIII}$ in the discrete counting system, and $\text{<<IIIIII} \text{<IIIIII}$ in the sexagesimal place value system.

3.3.2 The area system

The discrete counting system was not the only non-positional system in use in the Ur III and Old Babylonian periods; different systems were in use depending on

¹⁸See, e.g., [Uni16, §22.3.3, sub “Cuneiform Numerals”].

¹⁹These diagrams, which have become standard in discussions of Mesopotamian metrology, originate with [Fri78, p. 10], where they are called *step-diagrams*, see Figure 3.

$(G_{Ur III/OB})$

For areas smaller than a quarter *ikûm*, an overt unit is used, with one  (*sar*, *mûšarum*), approximately 36 m², written , equal to one hundredth of an *ikûm*, then sexagesimally subdivided in 60  (*gi₁*, *šiqlum*, “shekel”). For areas greater than 3600 *bûr*, the  and  numerals are reused with a suffix  (*gal*, “big”), as follows [Robo8, p. 295 nn. b, c; Fri07, p. 378; Rob19]:

e.g., \rightarrow \rightarrow

3.3.3 The capacity system

²⁰This sign is sometimes interpreted as a measurement unit, and transliterated *iku*, see, e.g., [Pro20, pp. 385 sqq.], or transliterations in [Feu04] discussed in §3.7.2. Even with this interpretation, the sequence of numerals used, and the interpretation of numerals shared with other metrological systems, is specific to system $G_{Ur III/OB}$.

²¹As in the surface of the field of (the city of Apisal) reported on [P102305, r. 1]

²²From [P213162], which has an additional , two thirds (of a shekel), see §3.3.5.

²³Used for volumes of grain, but also oil, dairy products, beer, etc., as well as to express the capacity of boats; volumes of earthworks instead use system $G_{Ur III/OB}$ based on a height of one cubit, see[[Pow87](#), p. 488; [Rob08](#), p. 294; [Rob19](#)].

numerals). Further, we have used the symbol \sim to express that, as described in [Hue11, p. 585 nn. (b), (f)], the sign 𒄠 GUR, while it is used only with volumes in excess of one gur, is written after the whole expression, after the overt unit sign 𒍪 if present, and after the word for “grain” if present, as in

 3554 gur 3 ban₂ 6 sila₃ of grain.

Observe that while large numbers of gur follow²⁵ system $S_{\text{Ur III/OB}}$, the use of horizontal (AŠ) numerals for the gur disambiguates from the vertical bariga, as 𒄠𒍪 would be 10 gur 1 bariga, and 𒄠𒍪𒄠 would be 11 gur; again even with some overt units, most of the numerals that participate in a metrological system have an interpretation dependent on that system.

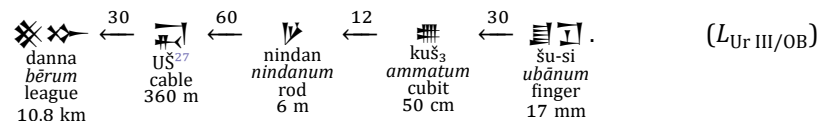

This intertwining of units and numerals explains the large number of already-encoded numeral series:

- 𒄠𒍪 used in $S_{\text{Ur III/OB}}$ and the SPVS as well as with overt units;
- 𒄠𒍪𒄠 used in $G_{\text{Ur III/OB}}$, of which 𒄠𒍪 are also used in $S_{\text{Ur III/OB}}$ and the SPVS as well as with overt units;
- 𒄠𒍪𒄠 used in $S_{\text{Ur III/OB}}$, and sometimes with overt units;
- 𒄠𒍪 used in $S_{\text{Ur III/OB}}$;
- 𒄠𒍪𒄠 used in $S_{\text{Ur III/OB}}$ and $G_{\text{Ur III/OB}}$;
- 𒄠𒍪𒄠 used in $S_{\text{Ur III/OB}}$ and $G_{\text{Ur III/OB}}$;
- 𒄠𒍪𒄠 used in $C_{\text{Ur III/OB}}$ as well as with overt units of the weight system;
- 𒄠𒍪 , 𒄠𒍪 , 𒄠𒍪 , 𒄠𒍪 , 𒄠𒍪 used in $C_{\text{Ur III/OB}}$;
- 𒄠𒍪 , 𒄠𒍪 , 𒄠𒍪 , 𒄠𒍪 used in $C_{\text{Ur III/OB}}$ —note the overlap with 𒄠𒍪 ;
- 𒄠𒍪 and 𒄠𒍪 used in $G_{\text{Ur III/OB}}$.

Only in the SPVS did numerals exist truly independently of metrology; to quote [Rob08, p. 78]: “The SPVS temporarily changed the status of numbers from properties of real-world objects to independent entities that could be manipulated without regard to [...] metrological system. [...] Once the calculation was done, the result was expressed in the most appropriate metrological units and thus re-entered the natural world as a concrete quantity.”

3.3.4 The length system

In the Ur III and Old Babylonian periods, lengths are expressed using overt units counted with 𒄠 and 𒄠 numerals with their system $S_{\text{Ur III/OB}}$ values. Since it does not have any unusual numerals, this system would not in itself be of much relevance to character encoding, but we present it here as background for its Early Dynastic counterpart presented in §3.4. Metrological tables use the following units²⁶ [Fri07, p. 118; Rob19]:

 danna 30 UŠ²⁷ 60 nindan 12 kuš₃ 30 šu-si (L_{Ur III/OB})
 bērum cable nindanum ammatum ubānum
 league 360 m rod cubit finger
 10,8 km 6 m 50 cm 17 mm

²⁴From [P309594, obv. 11].

²⁵A larger unit, the guru₇ (karûm, grain heap), is sometimes used instead, with 𒄠𒍪𒄠𒍪𒄠𒍪𒄠 (1 karûm = 3600 kurrû). See [Fri07, p. 415; Rob19].

²⁶In this factor diagram and the next, we do not include the numerals. The units are no more than a factor of 60 apart, so higher numerals such as 𒄠𒍪 or 𒄠𒍪𒄠 are not used.

Two more units appear occasionally [Pow87, p. 459; Fri07, p. 118; Rob19]:

$$\begin{array}{ccccccccccccccc} \text{𒀭} & \text{𒀭} & \xleftarrow{30} & \text{𒀭} & \xleftarrow{6} & \text{𒀭} & \xleftarrow{10} & \text{𒀭} & \xleftarrow{2} & \text{𒀭} & \xleftarrow{6} & \text{𒀭} & \xleftarrow{30} & \text{𒀭} & \text{𒀭} \\ & & & & & \text{eše}_2 & & & & \text{gi} & & & & & \\ & & & & & \text{ašlum} & & & & \text{qānum} & & & & & \\ & & & & & \text{rope} & & & & \text{reed} & & & & & \\ & & & & & 60 \text{ m} & & & & 3 \text{ m} & & & & & \end{array} \quad (\bar{L}_{\text{Ur III/OB}})$$

In addition, there are Akkadian names for the half-rope and half-reed, see [Pow87, pp. 463 sq.].

3.3.5 Fractions

Fractions of the *ikîm*, $\searrow = \frac{1}{2}$ and $\swarrow = \frac{1}{4}$, have already been encountered. In other contexts, the fraction $\frac{1}{2}$ is written 𒀭 , as in $\text{𒀭} \text{𒀭}$. The fractions $\frac{1}{3}$ and $\frac{2}{3}$ are written 𒀭 and 𒀭 . The latter two signs are derived from curviform signs 𒀭 and 𒀭 , which are already separately encoded; these are in turn derived from the sign 𒀭 (ŠU₂), whose Early dynastic form resembles 𒀭 , and 𒀭 numerals; see [Pow71, pp. 113, 134]. The 𒀭 is sometimes omitted, as in [P240545, verso 6 9; P221530; P221531; P271238; P274845].

3.4 Curviform numerals in early metrologies

At first sight, the metrological systems from the Early Dynastic period resemble the ones previously mentioned. In particular, the discrete counting system used in the Early Dynastic period (and earlier in the fourth millenium) clearly mirrors system $S_{\text{Ur III/OB}}$ [Fri07, p. 374; DE87, pp. 127, 165]:

$$\text{𒀭} \xleftarrow{10} \text{𒀭} \xleftarrow{6} \text{𒀭} \xleftarrow{10} \text{𒀭} \xleftarrow{6} \text{𒀭} \xleftarrow{10} \text{𒀭}. \quad (S)$$

Likewise the area system used in the Early Dynastic IIIb period for areas of one iku and greater [Dei22, p. 72; NDE93, p. 63; Fri07, p. 378; Lec16],

$$\text{𒀭} \xleftarrow{10} \text{𒀭} \xleftarrow{6} \text{𒀭} \xleftarrow{10} \text{𒀭} \xleftarrow{3} \text{𒀭} \xleftarrow{6} \text{𒀭} \quad (G_{\text{ED IIIb}})$$

mirrors system $G_{\text{Ur III/OB}}$, with consistent use of the numerals: \bullet corresponds to 𒀭 , \bullet to 𒀭 , and 𒀭 to 𒀭 . An exception to this correspondence, noted in [L2/04-099, p. 4] (see §3.2), is that the vertical 𒀭 from $S_{\text{Ur III/OB}}$ corresponds to a horizontal 𒀭 in system S . This is however far from the only case of such a reallocation of function. The earlier form of the area system is [DE87, pp. 141, 165; Fri07, p. 378]:

$$\text{𒀭} \xleftarrow{6} \text{𒀭} \xleftarrow{10} \text{𒀭} \xleftarrow{3} \text{𒀭} \xleftarrow{6} \text{𒀭}, \quad (G)$$

Observe that, as noted in [DE87, p. 142], 𒀭 changes meaning from $10\bullet$ in system G to $600\bullet$ in system $G_{\text{ED IIIb}}$. System G is used in the fourth millenium, but also in the ED I–II period (it is the “area 2” system in [Cha03], whereas $G_{\text{ED IIIb}}$ is the “area 1” system).

Another example of nontrivial correspondence between cuneiform and curviform numerals may be found by comparing the fractions the Early Dynastic IIIb

²⁷As indicated by the capitalization, the reading of this sign is unknown; see [Pow87, pp. 465 sqq.] for a discussion of various hypotheses.

systems; for instance, [Kre98, p. 303 n. 686] mentions the use of cuneiform numerals for days and months³⁵.

3.4.2 Dyke lengths in Nirsu

[Pow87, p. 466] notes that reeds “are regularly written with the normal, cuneiform end of the stylus. Higher units are usually written with the reversed (round) end of the stylus.” Powell does not elaborate on the specifics of this mixed use of numerals, but a cursory search in [CDLI] finds many occurrences³⁶, such as:

- [P221305, obv. 1 4]³⁷            
- [P020129, rev. 2 1]            
- [P221291, rev. 5 1]³⁸            
- [P221266, rev. 2 1]            

These expressions use an explicit sign  (counted in multiples of ten) or . This notation—but not its use of curviform numerals—is remarked on in [Lec20, p. 290 n. 27], which cites several of the instances listed above. It seems to be typical of texts about dykes. The notation can be summarized by the following factor diagram, where prefix units have been marked by an asterisk:

$$\begin{array}{c} \text{10} \quad \text{6} \quad \text{2} \quad \text{10} \quad \text{6} \quad \text{3} \\ \leftarrow \quad \leftarrow \quad \leftarrow \quad \leftarrow \quad \leftarrow \quad \leftarrow \\ \text{10} \quad \text{6} \quad \text{2} \quad \text{10} \quad \text{6} \quad \text{3} \end{array} \quad (L'_{ED IIIb})$$

3.4.3 Butter, cheese and wheat in Nirsu

A similar mixture of cuneiform and curviform numerals may be observed with the capacity system; indeed, the previously described    system uses  numerals for  [Fri78, p. 43; Lec16]:

$$\begin{array}{c} \text{10} \quad \text{6} \quad \text{10} \quad \text{4} \quad \text{6} \quad \text{6} \\ \leftarrow \quad \leftarrow \quad \leftarrow \quad \leftarrow \quad \leftarrow \quad \leftarrow \\ \text{10} \quad \text{6} \quad \text{10} \quad \text{4} \quad \text{6} \quad \text{6} \end{array} \quad (C_{\text{10} \text{6} \text{10}})$$

as in [P020016, rev. 1 4; P020065; P020090, obv. 1 3, rev. 2 1; P020092, rev. 3, 1; P020137, obv. 1 2] and others, where ban_2 counted with  numerals are followed by sil_3 counted with  numerals. Curviform numerals are also used to count sil_3 , but not⁴⁰ as part of the  systems. This contrast can be seen in [P220927], which measures butter ( i_3) with a different capacity system, using the  (dug,

³⁵That note also mentions a contrast between the use of curviform numerals to count people and curviform numerals to count bread allotted to them in [P010876]; such contrasts are more akin to styling, and might not, on their own, justify the disunification.

³⁶A search for curviform numerals followed by some number of reeds counted in (*tenû*) cuneiform numerals currently finds 125 occurrences across 47 tablets.

³⁷[CDLI] only has a copy, but a photo may be found in [Lec12, p. 82]. On that photo the  is not visible. Lecompte notes that the copy is faithful; indeed another  can be seen both on the copy and the photo on obv. 2 2.

³⁸From copy.

³⁹With either unit omitted, as in the examples above, or both, as in [P020129, obv. 3 3]  .

⁴⁰As of this writing, the single occurrence of ($\text{ban}_2@c$) followed by curviform numerals and sil_3 in ED IIIb Nirsu transliterations on [CDLI], 4($\text{ban}_2@c$) 3($\text{asz}@c$) sil_3 in [P221815, obv. 4 7], is incorrect: it should be 4($\text{ban}_2@c$) 3($\text{disz}@t$) sil_3 .

“pot”) of 20 𐎶 , with 𐎶 and \bullet numerals⁴¹ for both the 𐎶 and the 𐎶 , thus [Pow87, pp. 504 sq.]

$$\begin{array}{c} \bullet \xleftarrow{10} \text{𐎶} \xleftarrow{2} \bullet \xleftarrow{10} \text{𐎶} \xleftarrow{\frac{3}{2}} \text{𐎶} \xleftarrow{2} \text{𐎶}, \\ \text{𐎶} \quad \text{𐎶} \end{array} \quad (C \text{ 𐎶})$$

but counts cheese (𐎶 , ga’ar) using the 𐎶 capacity system, with 𐎶 numerals for the 𐎶 .

Another capacity system in ED IIIb Nirsu is the 𐎶 𐎶 , the gur of two ul [Lec16]:

$$\begin{array}{c} \bullet \xleftarrow{10} \text{𐎶} \xleftarrow{2} \text{𐎶} \xleftarrow{6} \text{𐎶} \xleftarrow{6} \text{𐎶}. \\ \text{𐎶} \text{ 𐎶} \end{array} \quad (C \text{ 𐎶} \text{ 𐎶})$$

Here the 𐎶 - 𐎶 - 𐎶 contrast occurs not only within the numerals of the system, but with its units; this is perhaps best illustrated by the expressions 𐎶 𐎶 𐎶 𐎶 𐎶 𐎶 𐎶 in [P221746, rev. 2 2] and 𐎶 𐎶 𐎶 𐎶 𐎶 𐎶 𐎶 in [P221814, rev. 1 5].

3.4.4 Grain in Ebla

The mixing of curviform and cuneiform numerals within a metrological system is not specific to Nirsu.

The system of grain⁴² capacities in Ebla uses the following units⁴³:

$$\begin{array}{c} \text{𐎶} \text{ 𐎶} \xleftarrow{2} \text{𐎶} \text{ 𐎶} \xleftarrow{\frac{5}{2}} \text{𐎶} \xleftarrow{4} \text{𐎶} \xleftarrow{6} \text{𐎶} \text{ 𐎶}. \\ \text{gu}_2\text{-bar} \quad \text{ba-ri}_2\text{-zu} \quad \text{gi}_4 \quad \text{ni}_2\text{-saṇṣu} \quad \text{an-zam}_x \end{array}$$

The 𐎶 𐎶 and 𐎶 𐎶 are generally counted using curviform numerals, and the smaller units using cuneiform 𐎶 numerals⁴⁴. Indeed, a search on [EbDA] for co-

⁴¹This tablet also uses subtractive notation: 𐎶 𐎶 𐎶 𐎶 “two pots minus two thirds (sila₃)”, \bullet 𐎶 𐎶 𐎶 𐎶 “ten minus one pots, six sila₃”. Such subtractive notation is common in most of the metrological systems discussed here; it appears in the ED IIIa period [Robo8, p. 77]. It presents no complexity for character encoding, but it is noteworthy that the sign 𐎶 (lal, “minus”) is often ligated with the following numerals, with the subtrahend placed under a sometimes considerably enlarged 𐎶 , similar to the layout of the radical in modern mathematical notation, see, e.g., [P020092, rev. 3, 1, 2]. A good font could handle the very common -1 case, perhaps even -2 and -3 ; setting arbitrary numeric expressions under the 𐎶 , or more generally replicating the layout of Early Dynastic tablets, is outside the realm of plain text; see also §6.2.

⁴²Liquid capacities use a different system [Arc15, p. 229 n. 12]:

$$\begin{array}{c} \text{𐎶} \text{ 𐎶} \xleftarrow{30} \text{𐎶} \xleftarrow{6} \text{𐎶} \text{ 𐎶}. \\ \text{la-ha} \quad \text{sila}_3 \quad \text{an-zam}_x \end{array}$$

A glance it seems that 𐎶 are counted with cuneiform numerals and higher units with curviform ones, thus

$$\begin{array}{c} \text{𐎶} \xleftarrow{\frac{5}{3}} \text{𐎶} \xleftarrow{6} \bullet \xleftarrow{10} \text{𐎶} \xleftarrow{3} \text{𐎶} \xleftarrow{10} \text{𐎶} \xleftarrow{6} \text{𐎶} \text{ 𐎶}, \\ \text{𐎶} \text{ 𐎶} \end{array}$$

but we have not investigated this thoroughly.

⁴³Another system uses different values for the 𐎶 and 𐎶 , see [Cha12, p. 62; Arc15, p. 229 n. 12]:

$$\text{𐎶} \text{ 𐎶} \xleftarrow{2} \text{𐎶} \text{ 𐎶} \xleftarrow{3} \text{𐎶} \xleftarrow{4} \text{𐎶} \xleftarrow{5} \text{𐎶} \text{ 𐎶}.$$

⁴⁴As mentioned in [Cha12, p. 63], the 𐎶 is also counted using the 𐎶 - 𐎶 numeral series. Some instances of that usage are found transliterated $n/6$ in [EbDA]; in some cases the 𐎶 sign is omitted, and the 𐎶 numeral is then written before the 𐎶 unit, as in 𐎶 𐎶 𐎶 from [P240545, verso 1 3].

occurrences of either $\mathbf{A} \rightarrow \mathbf{B}$ or $\mathbf{A} \rightarrow \mathbf{B} \rightarrow \mathbf{C}$ with either of $\mathbf{A} \rightarrow \mathbf{B}$ or $\mathbf{A} \rightarrow \mathbf{B} \rightarrow \mathbf{C}$ finds the following expressions⁴⁵:

- [illegible]

Note that higher numbers of $\text{𐎶} \perp$ are expressed in hundreds (*mi-at* 𒈹) and then thousands (*li-im* $\text{𒆸} \text{𐎵} \text{𐎶}$), as is typical in Ebla [Arc15, p. 33], e.g., in the last example above or in [P240532, verso 2 3], $\text{𐎠} \text{𒈹} \text{𐎶} : \bullet\bullet \text{𐎶} \text{𐎶} \text{𐎶} \text{𐎶} \perp$ ($(100 + 60 + 30 + 5 = 195)$ $\text{𐎶} \perp$ of grain). These expressions correspond to the following factor diagram:

3.4.5 Use in modern publications

Because of their prevalence in the fourth millenium and Early Dynastic period, the proposed numerals are widely used in modern publications discussing metrology

⁴⁵We cite here only one attestation per tablet; most tablets contain several expressions mixing cursive form 𐎠𐎢𐎡𐎢𐎠 and larger with cuneiform 𐎠𐎢𐎡𐎢𐎠 and smaller. In all cases the transcriptions given here are based on the [EbDA] transliterations, but the shape and orientation of the numerals was checked⁴⁶ on a photograph (from [EbDA] unless noted otherwise).

⁴⁶As we will see in §3.7.2, [CDLI] transliterations indicate numeral shape; however, as of this writing, they do so incorrectly on the Ebla corpus, claiming that all numerals are curviform, so we were not able to rely on them in this specific case.

⁴⁷ba-ri₂-zu₂, a variant spelling.

⁴⁸Short for .

⁴⁹Note the omitted $\square \downarrow$.

⁵⁰Instead of the expected $\mathbb{P} \{ \mathcal{E} \} = 1$.

⁵¹ not legible on the EbDA photo.

⁵²From [CDLI] photo.

⁵³From photo in [Arc89, p. 6].

⁵⁴Laid out as $||||$; on stacking patterns see §6.2.

⁵⁵From photo in [Arc89, p. 6]; see also the [CDLI] photo and the copy in [Fri86, p. 17]. This tablet features unusual usage of vertical numerals—“somewhat unorganized”, as described by [Fri86, p. 16]—, such as    or   , but its   and   are consistently counted with cuneiform numerals, and the higher units with cuneiform numerals.

⁵⁶Short for .

⁵⁷ŠU₂+NIN₂-san, an unusual variant spelling.

in those periods, as illustrated in Figures 1–20.

Since they contrast with the cuneiform numerals, they likewise appear contrastively in such publications. A remarkable example of that is found in Figure 20. The partial⁵⁸ transliteration “4 \triangleright $'a_3$ -da-um 4 \triangleright aktum 4 \triangleright $ib_2^{tu_9} \times 3 \uparrow$ sa₆ gunu₃” is used to illustrate a discussion of the interpretation of the contrast between \triangleright and \triangleright numerals. More conventional transliterations might omit the numeral shapes entirely, e.g., 4 $'a_3$ -da-um 4 aktum 4 $ib_2^{tu_9} \times 3$ sa₆ gunu₃, which would obviously be inadequate in this context. There are transliteration conventions that are more explicit about numeral shape, e.g., 4(aš^c) $'a_3$ -da-um 4(diš^c) aktum 4(aš^c) $ib_2^{tu_9} \times 3$ (diš) sa₆ gunu₃, but the result would be less readable. See §3.7.2 for a discussion of transliteration conventions for numerals.

for the words š u š a n a and š a n a b i . Deimel's reading
 š a n (a) for U came out of the reading $/š a n t a k/$ for the
 sign U and the writing of š a (- n a) after the fractional
 signs for š u š a n a and š a n a b i in Old Sumerian texts.
 But this was an ill-conceived argument at its inception, for

Figure 1: Discussion of the readings of proposed \triangleright and already-encoded \uparrow in [Pow71, p. 107].

sions also. In example 6, the writing š a n a b i may imply a
 reading $/š a n a b i/$,¹ whereas š a n a b i in example 11 should be
 read $*/š u š a n a m i n/$. Moreover, the question must be
 raised as to whether such writings as š a n a b i - š a n a b i
 $+ \text{š a - n a}^2$ do not perhaps imply a linguistic resolution of
 $*/š u š a n a m i n/$ rather than $/š a n a b i/$. I see no way
 of answering this question at present, but it is one which one

Figure 2: Discussion of the readings of proposed š a n a b i and š a n a b i as well as already-encoded š a n a b i and š a n a b i in [Pow71, p. 138].

⁵⁸The untransliterated text would be $\text{š a n a b i} \times 3 \uparrow$; note the atomically encoded $ib_2 \times 3 \uparrow = \text{š a n a b i} \times 3 \uparrow$.

1 "big cup" = 3 "big disks". Hence we can infer from the two SE-texts BIN 8,4 and BIN 8,5 together, that the "SE-system" makes use of number signs whose values are related to each other through the equations

$$1\overline{\cup} = 3\bigcirc, 1\bigcirc = 10\bullet, 1\bullet = 6\overline{\cup}, 1\overline{\cup} = ?\overline{\cup}$$

A more convenient way of saying the same thing is to write out the "steps" between the various SE-units in what we shall call a "step-diagram" for the "SE-system":

Figure 3: The first factor diagram, in [Fri78, p. 10].

$$\begin{cases} 4\overline{\cup} 5\bullet = 24\overline{\cup} 3\bullet & (C 234) \\ 5\overline{\cup} 1\bullet 1\overline{\cup} = 5\overline{\cup} 7\bullet & (C 314) \\ 1\overline{\cup} 1\overline{\cup} 1\overline{\cup} 1\overline{\cup} = 6\bullet 2\overline{\cup} 1\overline{\cup} & (C 27) \end{cases}$$

These metrological equations for the "unknowns" $\overline{\cup}$, \bullet , $\overline{\cup}$, etc., can be treated exactly as ordinary equations for unknowns x , y , z , In particular, the equations can be simplified by subtraction of equal amounts from both sides of the identities. In this way the three equations above can be reduced to:

$$\begin{aligned} 2\bullet &= 20\overline{\cup} & (4\overline{\cup} 3\bullet \text{ subtracted from both sides}) \\ 1\overline{\cup} &= 6\bullet & (5\overline{\cup} 1\bullet - " - " -) \\ 1\overline{\cup} &= 6\bullet 1\overline{\cup} 9\overline{\cup} & (1\overline{\cup} 1\overline{\cup} - " - " -) \end{aligned}$$

We can now read off from the first equation that $1\bullet = 10\overline{\cup}$, and from the second that $1\overline{\cup} = 6\bullet$. Then the third equation can be simplified (by "substitution" of these values into the equation), to the following reduced form:

$$1\overline{\cup} = 2\overline{\cup} 9\overline{\cup}.$$

The most likely solution to this last equation is, of course,

$$1\overline{\cup} = 2\overline{\cup}, \quad 1\overline{\cup} = 10\overline{\cup}.$$

Figure 4: The derivation of the factors of the bisexagesimal system in [Fri78, p. 15]⁶⁰.

⁶⁰The bisexagesimal system is used alike in proto-Elamite and proto-cuneiform texts, see [Fri78, p. 38]; the derivation in [Fri78, p. 15] is based on proto-Elamite artefacts. Note that in Friberg's early works [Fri78; Fri79; Fri86; Fri87], copies of fourth millenium and sometimes third millenium tablets are shown as vertical text (which they were for the scribes), and their numerals are written within horizontal text in the same orientation that they have if the tablet is taken as vertical text; in [UAX50] parlance, as if they had Vertical_Orientation=Upright. In addition, they are listed in these equations in the horizontal order in which they appear as vertical text (thus the rightmost numeral is the most significant, read first). Cuneiform is correctly Vertical_Orientation=Rotated, consistently both with modern practice and with the rotation between earlier vertical and later horizontal monumental inscriptions. Friberg's early conventions are not followed in later scholarship, and are abandoned in his own more recent works, such as [Fri07]; a more typical way to express the first equations might be

$$\begin{aligned} 5\bullet + 4\overline{\cup} &= 3\bullet + 24\overline{\cup} & (C 234) \\ 1\overline{\cup} + 1\bullet + 5\overline{\cup} &= 7\bullet + 5\overline{\cup} & (C 314) \\ 1\overline{\cup} + 1\overline{\cup} + 1\overline{\cup} &= 1\overline{\cup} + 2\overline{\cup} + 6\bullet & (C 27) \end{aligned}$$

Thus, for instance, the original set of fractions ∇ , \triangleleft , and \blacktriangledown ($1/2$, $1/4$ and $1/8$ of an iku) in the Sumerian GANA system, was after a time augmented through the addition of the new sub-unit SAR: 𒌦 , equal to $1/100$ of an iku (\triangleleft). Similarly, the Sumerian weight unit "na-na" which originally may have had only the sub-units 𒌦 ša-na (= $1/3$ mana) and 𒌦𒌦 ša-na-bi (= $2/3$ mana), and perhaps also gin: 𒌦𒌦𒌦 (= $1/60$ mana), seems to have acquired, at some time or other, also the smaller sub-units 𒌦𒌦𒌦𒌦 (= $1/3$ gin), and 𒌦𒌦𒌦𒌦𒌦 = še (= $1/3 \times 1/60$ gin).

Figure 5: Discussion of proposed fractions ∇ , \triangleleft , \blacktriangledown , and 𒌦 , as well as already-encoded 𒌦 and 𒌦 in [Fri78, p. 49].

stein publizierten Zeichenliste enthalten ist³, bis vor kurzem unentdeckt bleiben konnte. Erst 1978 machte der schwedische Mathematiker J. Friberg, ERBM I, 9-11, darauf aufmerksam, daß die Zeichen für die Zahlen Eins (\triangleleft) und Zehn (\bullet) in Verbindung mit dem Zeichen ŠE nicht im Verhältnis 1 zu 10 sondern im Verhältnis 1 zu 6 stehen. Bis dahin hatte man, obwohl die Andersartigkeit des in Verbindung mit dem Zeichen ŠE verwendeten Zahlzeichensystems bekannt war, für diese beiden häufigsten Zahlzeichen einheitlich ein Verhältnis 1 zu 10 unterstellt, obwohl es mehrere eindeutige Gegenbelege gab, von denen zumindest diejenigen der Archaischen Texte aus Gemet Nasr bereits früh publiziert und jedermann zugänglich waren⁴. Als Folge

Figure 6: Discussion in [DE87, p. 117] of the discovery in [Fri78, pp. 9–11] (see Figure 3) of the different relations between \triangleleft and \bullet in systems G and ??.

there is in any case an important qualitative difference between IX for Latin novem and \bullet for Sumerian niš. niš seems to be a primary numberword requiring, in a system depicting Sumerian numeration, a differentiated representation comparable

Figure 7: The sign \bullet used in a parallel with IX in [Eng88, pp. 131–133 n. 9], discussing an argument from [Pow72, p. 172] on the question of the language of the Uruk III texts.

of decreasing fractions $1/n$ of this measure, whereby "n" was determined by the number of oblique impressions made by the rounded end of a thin stylus around a central point in a specific sign. Thus $\text{𒌦} = 1/2 N_{30}$, $\text{𒌦} = 1/3 N_{30}$, and so on. The first sign of the latter units, N_{34} ,

Figure 8: Description of the fractions 𒌦 and 𒌦 in [Eng98, p. 113]⁶¹.

A diplomatic edition of [Fri78] could rotate the numerals using a higher-level protocol:

$$\begin{cases} 4\text{𒌦} 5\bullet = 24\text{𒌦} 3\bullet & (\text{C } 234) \\ 5\text{𒌦} 1\bullet 1\text{𒌦} = 5\text{𒌦} 7\bullet & (\text{C } 314) \\ 1\text{𒌦} 1\text{𒌦} 1\text{𒌦} 1\text{𒌦} = 6\bullet 2\text{𒌦} 1\text{𒌦} & (\text{C } 27). \end{cases}$$

⁶¹The text erroneously has N_{34} instead of N_{24} .

For instance, the first line contains the notations $1N_{34} 1N_{39a} ; 2N_{20}$, which can be translated '60 of the (grain rations containing) \ominus (of grain); (grain involved:) 2 \bullet (of ground barley)'. This calculation contradicts the assumed numerical relationship $10N_1 = 1N_{14}$, since as was well known the measure represented by the sign N_{39} was $1/5$ of that represented by N_1 , so that $60 \times 1/5 = 12$ and not 20, as $2N_{14}$ would imply. Instead of relying on complicated

Figure 9: The sign \ominus used as a capacity measure within otherwise translated text in [Eng98, p. 116].

Die halbkreisförmigen Griffelindrücke gehen manchmal in mehr oder weniger eckige Formen über (∇)⁶⁵. Es gibt aber auch Einer in Form von regelrechten – meist mehr oder weniger schräggestellten – Keilen (\nwarrow), die öfters neben halbrunden Einern vorkommen und mit diesen kontrastieren⁶⁶. Selten treten mit ∇ gebildete Zahlen auf⁶⁷ (sie entsprechen den bariga-Zahlen im Hohlmaßsystem, s.u. 7.4).

Figure 10: Discussion of co-occurrences and contrasts between ∇ , \nwarrow , and ∇ in [Kreg98, p. 303].

The calculations:

Obv. i	1	$60 \times 1/5 \nabla$	(\ominus)	=	$12 \times \nabla$	=	$2 \times \bullet$
	2	$120 \times 1/10 \nabla$	(\boxminus)	=	$12 \times \nabla$	=	$2 \times \bullet$
	3	$120 \times 1/15 \nabla$	(\boxplus)	=	$8 \times \nabla$	=	$1 \times \bullet$ $2 \times \nabla$
	4	$300 \times 1/20 \nabla$	(\boxtimes)	=	$15 \times \nabla$	=	$2 \times \bullet$ $3 \times \nabla$

Figure 6. Transliteration and calculations of MSVO 4, 66.

Figure 11: Calculations from [P005468] transcribed in [Eng01, p. 132] using modern mathematical notation combined with some of the proposed characters.

strong similarities between “area” 1 and “area” 3 systems, the sign with two concentric discs (\odot , notated N_{50} ²⁷) remains problematic. It never appears in any numerical combination with the sign with a single disc (\bullet),

Figure 12: Discussion of \odot and \bullet ⁶² in [Cha03, p. 6].

$1/15$, etc., of gur, we would expect the metrogram gur to appear in sub-column ii. In a certain way, it does for larger measures: the notation $\text{𒌦} \text{𒌦}$ could be understood as $1 \frac{1}{5}$ gur.²⁷ However, the metrogram gur does not appear for lower measures. It would not be consistent to attribute different functions to the same grapheme, according to the relative importance (be it great or small) of the quantity, so the signs 𒌦 and 𒌦 cannot be considered klsmatograms.

Metrological tablets from the end of the 4th millennium (Nissen, Damerow and Englund 1993, 55-59, to *MSVO* 1, nos. 2-3) contain a discrete set of numerical signs with specific surface area reference:

𒌦 1(iku) represents a surface of 3600m²
 𒌦 1(eše₃) represents a surface of 21,600m²
 etc.

The signs iku and eše₃ constitute by themselves measures of surface areas. These measures are usually followed by the sign GAN₂, which means either surface or field and

Figure 13: Discussion of Old Babylonian⁶⁴ capacity and fourth millenium area measures in [Pro09, p. 9].

formed by only two signs 𒌦 and 𒌦 , repeated as many times as necessary; this type of notation is highly standardized. Second, the order of magnitude of the numbers noted in this system is not indicated: 1, 60, 60², 60³, 1/60, 1/60², etc. are written in the same way, with the vertical wedge 𒌦 . The third feature concerns the exact function of

Figure 14: Description of the SPVS in [Cha12, p. 58], using the already-encoded signs 𒌦 and 𒌦 .

one step. The scribes of the Early Dynastic Period (c. 2600 BC), for instance, represented the number 648,000 with: $\text{𒌦} \text{𒌦} \text{𒌦}$ but never with the repetition $\text{𒌦} \text{𒌦} \text{𒌦}$.

Figure 15: Discussion of large numbers illustrated by $\text{𒌦} \text{𒌦} \text{𒌦}$ ⁶⁵ in [Cha12, p. 59]

repetition of the same sign refers to both the capacity unit signified—often but not necessarily written immediately afterwards—and its value. The units of measurement are written in descending order from left to right—just as we would write 3 km, 120 m, 50 cm. For example:

$\text{𒌦} \text{𒌦} \text{𒌦}$ še bar 𒌦 ba-rí-zu
 ‘3 gubar (capacity units) and 1 parisu’.

Figure 16: Partial transliteration of [P240597, recto 5 3] $\text{𒌦} \text{𒌦} \text{𒌦} \text{𒌦} \text{𒌦} \text{𒌦}$ in [Cha12, p. 61].

⁶²The statement that these do not co-occur refers to the texts from ED I-II Ur; these signs co-occur both earlier and later in areas, with different relations as previously discussed.

⁶⁴The cuneiform text is Unicode-encoded.

⁶⁵Compare $\text{𒌦} \text{𒌦}$ in system *G_{Ur III}/08*. Sign order can be variable in early texts, see [Fox16, p. 8]. See [P010773], also discussed in [Fri07, p. 148], for an example of $\text{𒌦} \text{𒌦}$, and [P274845; P241764] for examples of $\text{𒌦} \text{𒌦}$.

This is particularly true of the signs , ,  and , whose form explicitly denotes the fractions 1/6, 2/6, 3/6, and 4/6 of the barig capacity measure written  in Mesopotamia—also transcribed by Assyriologists as 1 bán, 2 bán, 3 bán, and 4 bán with reference to the bán measure worth 1/6 of the barig. At Ebla, the sign  is most often associated with the *parisu* measure, while the signs , ,  and  refer to 1, 2, 3,

Figure 17: Discussion in [Cha12, p. 64] of the relation between – and  in Mesopotamia and in Ebla.

shape. The principle of notation is additive: each sign is noted as many times as necessary (e.g.,    transliterated as 2(šar₂) 1(geš'u) 3(u), means $2 \times 3600 + 1 \times 600 + 3 \times 10$). The system is based on an alternation of factors ten and

Figure 18: Explanation of the structure of the number  in [Pro20, p. 350].

might think of one fabric and a half,¹¹ but the presence of notations with “2  2 ”, “3  3 ”, and “6  6 ” (Fig. 1) elements excludes that one deals with fractions, as these notations are not consistent with those of Šuruppag’s weight measurement system.¹² The notation “1  gada” in o. ii 1 and r. vi 1, along with the total of “39

3.5 Non-numeric usage

The beginning of the scribal art is a single wedge. That one has six pronunciations; it also stands for 'sixty'⁶⁶. Do you know its reading⁶⁷?

Examenstext A

Many of the cuneiform numerals are used with a logographic or phonetic value. For example, the sign has, *inter alia*, the values *aš*, *rum*, and *dili*. While the horizontal numerals are most frequently written in the Early Dynastic period⁶⁸, such non-numeric usage is almost⁶⁹ always written , for instance:

- in personal names in administrative texts, such as the following, which all contain numerals:
 - in [P010424, rev. 1 5; P010458, obv. 1 5; P010459, obv. 2 5'] from ED IIIa *أبو صلابيخ*,
 - in [P010960, obv. 2 5] from ED IIIa Šuruppag,
 - in [P251641, obv. 4 3] from ED IIIb Adab,
 - in [P252866, rev. 2 3] from ED IIIb Adab,
 - in [P298637, rev. 2 4] from ED IIIb Umma;
- in the Sumerian word *u₂-rum*, “property” in ED IIIb Nirsu administrative texts which contain numerals, such as [P020006, obv. 2 3; P020008, rev. 1 2; P020018, rev. 1 2; P020024, obv. 1 4; P020030, obv. 3 1];
- in lexical texts:
 - in the divine name in the lexical texts [P010570, rev. 2 4; P010572, obv. 3 6], where the entries are prefixed with .
 - in the word *dili*, “small fish” in [P010578, obv. 2 5], witness to Early Dynastic Fish,
 - in the same word with a determinative, *dili^{ku}*, in [P010586, obv. 4 4, 6], witness to Early Dynastic Food, which starts with numerals.

This is a clear contrast between and in this period, and genuine ambiguity can arise if it is lost; for instance, the personal name occurs on its own line in the aforementioned administrative texts; a line would instead be read as “one slave”.

3.6 The limited benefits of diachronic encoding for numerals

The argument in favour of diachronic encoding is that it facilitates interoperability in a variety of use cases, as we have outlined in §3.1. While these benefits are real and

⁶⁶The reader will recall that *neš₂* is written , with a larger wedge than ; however, these signs have merged by the time Examenstext A is composed.

⁶⁷Besides *neš₂*, a look at [OSL] shows that the values *diš*, *ge₃*, *makkaš*, *san₂ak₄*, and *tal₄* are attested both in [ePSD₂] and in lexical lists. The sign is also used for the Akkadian word *ana* in the Neo-Assyrian period.

⁶⁸A [CDLI] search for “(asz@c)” finds 3296 ED texts, while a search for “(asz)” finds 81 ED texts, of which 46 also contain “(asz@c)”.

⁶⁹Exceptions are discussed in §3.7.1.

3.7 Compatibility considerations

A disunification twenty years after the fact, affecting all numerals, would ordinarily be a serious compatibility issue. Fortunately, with the exception of one character discussed below, we are not aware of any font using curviform glyphs for the already-encoded numerals. In fact we are not aware of any font designed for a style earlier than Old Babylonian, except for fonts mimicking the representative glyphs from the code charts, which are primarily Ur III, but sometimes earlier or later, as described in [UTR56, §2.4]. The lack of dedicated Ur III fonts may be explainable by the chart-like fonts⁷⁴ being good enough for most purposes; the lack of Early Dynastic fonts, by the aforementioned issues with numeral unification making the representation of any text with numerals intractable.

3.7.1 The case of ŠAR₂

The character U+122B9  CUNEIFORM SIGN SHAR2 has a circular reference glyph.

In most texts from the Early Dynastic IIIb and Old Akkadian period⁷⁵, a contrast between non-numeric šar₂ written  and numeric 1(šar₂) written  can be observed, similar to the contrast between  and  previously discussed in §3.5. However, in lexical lists from Šuruppag and Ebla⁷⁶, as well as in the *Stèle des vautours*, non-numeric šar₂ is curviform:

-     and     in [P010566, obv. 10 10, 11];
-   and    in [P010576, rev. 3 16, 17];
-   in [P240986, recto 3 3]⁷⁷;
-   in [P222399, obv. 17 9, 18 11, 22 12]⁷⁸.

It *would* be disruptive to the diachronic representation of text if non-numeric šar₂ were to have two different representations. The character U+122B9 CUNEIFORM SIGN SHAR2 should therefore be used in those cases, with its curviform glyph , identical to the glyph of the proposed U+12579  CUNEIFORM NUMERIC SIGN ONE N45. Since the archaizing style of texts wherein non-numeric šar₂ is curviform solidly predates the transition from  to  in the relevant metrological systems, there is no need to represent a - contrast, so these characters can have the same glyph in specialist archaizing Early Dynastic fonts.

Since cuneiform U+122B9 CUNEIFORM SIGN SHAR2 effectively merges with U+1212D  CUNEIFORM SIGN HI, the reference glyph should remain as it is, *i.e.*, curviform, so that the contrast between reference glyphs within the Cuneiform block remains clear; see [UTR56, §2.4]. Since system fonts follow the reference glyphs, and since extant specialist fonts target styles where U+122B9 is unambiguously cuneiform, there are no compatibility issues.

⁷⁴Most prominently Noto Sans Cuneiform, a system font on both Windows—as part of Segoe UI Historic—and macOS.

⁷⁵For example, in personal names:

-    in [P020019, rev. 1 2] from ED IIIb Nirsu;
-    in [P020182, obv. 2 9], also from ED IIIb Nirsu;
-   in [P222186, obv. 3 3] from ED IIIb Umma;
-    in [P235312, obv. 16] from Old Akkadian Umma.

⁷⁶These are archaizing in other ways, *e.g.*, they have a  (NAM₂-TUG₂) split.

⁷⁷From copy in [Man81, No. 397].

⁷⁸Note however    on [P222399, obv. 6 17], see Figure 21. Curviform non-numeric šar₂ is clearly archaizing in ED IIIb Nirsu; one might suppose that the scribe slipped into their modern ways here.

Figure 21: [P222399, obv. 6 16–17] 𒌦𒌦𒌦𒌦𒌦𒌦 / 𒌦𒌦𒌦𒌦𒌦𒌦.

Note that in rare cases, such as [P222243, obv. 2 7] from ED IIIa Adab, non-numeric 𒌦 (here with the value rum) is written 𒌦. It is out of scope for this proposal to decide whether such occurrences should be treated as anomalous spellings, encoded as U+12550 𒌦 cuneiform numeric sign one N01, or as stylistic distinctions, encoded as U+12038 CUNEIFORM SIGN ASH with a curviform glyph. In practice this would often be determined by the transliteration from which the cuneiform text is generated; it is noteworthy that as of this writing, the [CDLI] transliteration (UR2-1(aš@c)) and the [ePSD2] one (uru₈^{rum}) of this word disagree on that aspect. Since 𒌦 has a cuneiform reference glyph, this does not pose any compatibility concerns.

3.7.2 Transliteration

An important feature of the encoding is that, in order to support input and bulk conversion of transliterated corpora to Unicode cuneiform, it should not represent distinctions that are finer than those recorded in typical transliterations; thus, while some older forms of BIL₂ can be described as 𒌦𒌦𒌦𒌦 NE×KASKAL or 𒌦𒌦𒌦𒌦 NE×PAP⁷⁹, they are typically all transliterated bil₂, and therefore are all represented by the character U+1224B 𒌦 CUNEIFORM SIGN NE SHESHIG, its name notwithstanding, as described in [UTR56, §2.5].

The situation is more complicated for numbers. Many transliterations do not represent the type of numeral used, instead interpreting the whole numeric expression and transcribing it with delimiters or units as needed to disambiguate. For instance, 𒌦𒌦𒌦𒌦 from [P305639, rev. 21] may be transliterated as 95 gur, as in [Feu04, vol. 2, p. 62]. The numerals may also be transliterated separately, but solely by their values in terms of the overt unit, as in [EbDA] transliterations: the aforementioned 𒌦𒌦𒌦𒌦 𒌦𒌦𒌦𒌦 𒌦𒌦𒌦𒌦 𒌦𒌦𒌦𒌦 𒌦𒌦𒌦𒌦 from [P240533, recto 3 3] is transliterated “20-1-1/2 gu₂-bar 7 nig₂-sagšu 2-1/2 an-zam_x⁸⁰ za”, reading both 𒌦 and 𒌦 as 1/2, but not distinguishing them.

⁷⁹As on [P249253].

⁸⁰As of this writing, [EbDA] actually has an-zam_x, with U+1D6A GREEK SUBSCRIPT SMALL LETTER CHI.

In particular, these transliterations do not differentiate between \neg and \intercal numerals, nor between \triangleright and \triangleright numerals. For instance, the aforementioned [P242293, *recto* 4 1]  is transliterated “4 ‘a₃-da-um^{tug₂}-II 4 aktum^{tug₂} 4 ib₂-III gun₃ sa₆^{tug₂}” in [EbDA], with no distinction between the  and . Since \neg and \intercal numerals are separately encoded, the numeric expressions in such transliterations cannot be transformed into Unicode cuneiform without additional context, regardless of curviform–cuneiform unification.

In metrological systems such as systems $G_{Ur III/Ob}$ and $C_{Ur III/Ob}$ where some units are indicated by the type of numeral rather than an overt unit sign, it is common practice to add the unit in parentheses in transliteration; for instance, $\neg \neg \neg \neg \neg \neg \neg \neg$ from [P386847, obv. 1] is transliterated “1(eše₃) 5½ iku⁸¹ 7 sar” in [Feu04, vol. 2, p. 176], and $\neg \neg \neg \neg \neg \neg \neg \neg$ from [P307255, obv. 12] is transliterated “1(n⁸²) 2(b) 7 ½ sila₃” in [Feu04, vol. 2, p. 151].

This practice has been generalized to systematically indicate numeral shape; this is in particular the case in [CDLI], where the transliterations of some of the above examples are “1(gesz2) 3(u) 5(asz) gur” for $\neg \neg \neg \neg \neg \neg \neg \neg$, “1(esze3) 5(iku) 1/2(iku) GAN2 7(disz) sar” for $\neg \neg \neg \neg \neg \neg \neg \neg$, and “3(barig) 2(ban2) 7(disz) 1/2(disz) sila3” for $\neg \neg \neg \neg \neg \neg \neg \neg$. [CDLI] and [ePSD2] both distinguish curviform from cuneiform numerals in transliteration: the length  from [P020129, rev. 2 1] is transliterated “6(gesz2@c) 3(u@c) {ninda}nindax(DU) 1/2(asz@c) 4(disz@t) gi” in [CDLI], and “6(geš₂^c) 3(u^c) ninda_{ninda_x}(DU) 1/2(aš^c) 4(diš^t) gi” in [ePSD2]. Another example is [Mol14, p. 39], which uses 1a for \neg , 1d for \intercal , 1ac for \triangleright , 1dc or ½dc for \triangleright depending on reading, etc. The literature on the Uruk and Early Dynastic I–II periods uses a different set of transliteration conventions that also disambiguate numeral shapes, as will be discussed in §4.

While there exist transliterations that distinguish \neg from \intercal but not  from \neg , such as the ones used in [DCCMT], the trend, especially in more recent works in third millennium studies, seems to be to represent numeral shape; for example, [MV24] gave an example of the input syntax used by the new “Urban Economy Begins” project as “10 + 5c(GUR) + 2(BARIGA) + 1(BAN2)” for $\bullet \bullet \bullet \neg \neg \neg$, with a c indicating that the GUR numerals are curviform, and the parenthetical GUR indicating that these are \triangleright rather than \triangleright numerals. The “tradition of cavalierly dispensing with numerical notations in notations of administrative documents”, as [Eng04, p. 30] describes it, seems to be fading.

3.8 Conclusions

Co-occurrences of curviform and cuneiform numerals are not anecdotal in the Early Dynastic period, nor are they the result of scribal idiosyncrasy. Instead, they represent systematic contrasts between metrological systems, between individual units within metrological system, and between numeric usage and phonetic or logographic usage. This contrastive usage is reflected in modern publications. The contrast frequently applies to individual numerals, rather than to the span of entire numeric expressions.

While it would be technically possible to handle this contrast as a stylistic distinction, this approach has no real benefit, and is highly inconvenient, as it would require any treatment of Early Dynastic administrative texts to use multiple

⁸¹  interpreted as a unit, as discussed in §3.3.

⁸² short for nigida, an older reading of bariga; see [Landsberger1950; Pow75, p. 181; Fox22, p. 9].

cuneiform fonts, often within single numeric expressions. Further, if that contrast is lost in plain-text interchange, the text can be misinterpreted: \llcorner is a length of three ropes, but $\bullet\bullet$ is an area of three bur₃; $\triangleright\lrcorner$ could be read as one $\llcorner\lrcorner$ and one $\lrcorner\lrcorner$, where $\triangleright\lrcorner$ would be one and a half $\llcorner\lrcorner$; $\lrcorner\lrcorner$ is a personal name, but $\triangleright\lrcorner$ would be “one slave”.

In addition, there would be a risk of confusion about character identity should fontmakers attempt to treat the curviform and cuneiform numerals as unified. A designer concerned about the numeric-syllabic $\triangleright\lrcorner$ contrast, and wishing to support diachronic encoding between systems $S_{\text{Ur III/OB}}$ and S , might give the \lrcorner numeral series (which is typically only used numerically in the Early Dynastic period) the glyphs of the \triangleright numeral series, since the clear $\lrcorner\lrcorner$ identification involves the same rotation; this would however make it impossible to represent capacity measures that use \lrcorner . Similarly, in an effort to support diachronic encoding for 1/2(iku), one might be tempted to give \lrcorner the glyph of \lrcorner , thereby rendering the font unusable for quantities measured using the \lrcorner numeral series; an ED I–II Ur font designer could decide to give \lrcorner the same glyph as \lrcorner (that of the proposed \bullet), according to the older area system, making it impossible to represent the newer system.

At the same time, contrary to most disunifications, the separate encoding of curviform numerals poses no serious compatibility issues for existing fonts or encoded corpora, nor does it, in general, introduce new issues with transliterated third millennium corpora. The oddity of \bullet requires some explanation, but does not pose any architectural issues, and is not fundamentally different from the other mergers and splits encountered in the cuneiform script.

4 Rationale for ED–Uruk numeral unification

A complete rationale for disunification between the non-numeric signs used in the fourth millennium and the already-encoded cuneiform signs will be given in the forthcoming proto-cuneiform encoding proposal. The core issue with extending the cuneiform script further back in time is that, since 1987, fourth millennium studies have used a different model of character identity and associated transliteration conventions, with names being given to structurally different glyphs, and no attempt being made at assigning phonetic values to them.

This is not a mere classification of glyph variants, as contrastive meanings of these systematic variants can often be reconstructed, with, *e.g.*, signs $KA\check{S}_a$, $KA\check{S}_b$, and $KA\check{S}_c$, depicting filled jars with a spout (a), a handle (c), or neither (b), being understood as referring to containers of different substances, see [Eng01, pp. 34 sq.]. However, not all identified systematic variants are understood, and the general approach to character identity is closer to that used for undeciphered or partially deciphered scripts.

As part of the development of these conventions, a classification of fourth millennium numeric signs was developed; see [DE87]. This classification assigns to each unit numerals an identifier formed by the letter N with a numeric subscript (sometimes with an additional alphabetic subscript): N_1 is \triangleright , N_{14} is \bullet , N_{34} is \lrcorner , etc. Transliterations of numeric expression then use those to identify the type of number used, thus $5N_1$ is $\lrcorner\lrcorner$, and $5N_{14}$ is $\bullet\bullet\bullet$.

In contrast with the use of parenthetical unit names, this approach does not require interpreting the quantity being counted. This is valuable in contexts where

numerals are being used atypically, as conventional transliterations can otherwise force a dubious interpretation. For instance, the [CDLI] transliteration of    or   in [P283802, rev. 1 6, 2 2] currently uses (barig@c) for the vertical numerals, since  numerals are typically capacity measures; but [Gor23] interprets these instead as counting linen textiles. As a result, the fourth millenium conventions for numeral transliteration are used in Early Dynastic texts, especially those from the ED I–II period, even though the Sumerian text uses classical assyriological transliteration conventions; see [Cha03, p. 6 n. 27].

While the non-numeric signs are treated as undeciphered, the metrological systems used in the fourth millenium are well understood, as can be seen in [DE87, p. 165]. As a result, contrary to the non-numeric proto-cuneiform conventions, these numeric transliteration conventions are compatible with the classical ones described in §3.7.2; they are indeed used interchangeably, as in [P01104] which uses the notation u@f in [ePSD2], but N14@f in [CDLI]. Indeed, the numerals are used similarly in Early Dynastic metrological systems, and are visually identical.

A disunification of numerals between the third and fourth millenium would therefore induce confusion as to which numerals should be used in third millenium studies, and would needlessly duplicate the encoding of at least seventy characters; by splitting the attestations, these separate encoding proposals would run into additional difficulties to supply evidence for encoding.

Note that the structural variants designated by letters in fourth millenium notation have systematically been encoded, as they have occasionally be found to carry distinct numeric meaning. For instance,  N_{30c} is listed as a variant of  N_{30a} in [DE87, p. 166], where the numeric value of either in relation to  N_{39a} is still unknown, but their values are found in [Eng04, p. 33] to be  = $\frac{1}{10}$ , whereas  = $\frac{1}{6}$ .

5 Considerations on individual numeral series

[TODO Document to the extent possible the metrological systems in which each sign is used. Note the disunification of N9 and N10 from 4(ban₂@c) and 5(ban₂@c).]

6 Characters not included in this proposal

6.1 Missing numerals

TODO “Ten of the sixty numerical signs contained in the list in figure 27, moreover, do not belong to any of the identified systems. Three of them were apparently scribbled by an awkward pupil. As to four of those remaining, we are not sure whether they constitute derivations of other, as yet unknown numerical signs or whether they are in fact numerical signs at all. For at least two of the ten signs, txi and we can affirm that each formed part of two additional systems, about which we know nothing due to the fact that no informative texts have been unearthed with notations in these systems.” [NDE93, p. 27] TODO N10 described as coming from P001319 which does not have it anymore. TODO N13 not attested in CDLI TODO (N₁₇ not usefully numeric, 12N₁₄ not encodable, etc.). Cite [DE87, p. 147] 7 and 8(diš *tenû*) encodable, but not today; want to go into the Cuneiform Numbers and Punctuation block for sanity.

Figure 22: The layout of case [P011099, rev. 2 3]; the numeral  is rotated to fit the rounded corner of the tablet.

6.2 Stacking patterns

The already-encoded numerals in the Cuneiform Numbers and Punctuation block distinguish some *stacking patterns*; for instance 9I is encoded both as U+12446  and as U+1240E . This is in part due to contrastive usage of stacking patterns. For instance, besides  and  which are characteristic of bariga measures, four bariga is written  even where 4I is written , as in [P255010, obv. 2 3, rev. 1 17; P292843, obv. 4, rev. 5]. Another contrast is that between the stacking patterns used in scratch calculations in the SPVS, often                           

astic period, but that are also attested in the fourth millennium in the Uruk III period; the fourth millennium, especially the Uruk IV period, also frequently features numerals that use a more vertical layout, as illustrated in Figure 24. The later, more horizontal styles were chosen for two reasons: for the numerals used in the third and fourth millennium, usage in third millennium scholarship will be more frequent; and the horizontal layout poses fewer layout difficulties when set in lines of non-cuneiform text, as most modern scholarship is. Indeed, the absolute size of the indents \triangleright , \curvearrowright , \bullet , and \bullet must remain consistent across the numeral series, lest a \curvearrowright numeral be confused with an \triangleright numeral. Since the single indents are frequently used in running text, as illustrated in §3.4.5, they need to be large enough that the vertical stacking patterns are impractical.

Variant stacking patterns, if needed, may be handled at a higher level as stylistic distinctions; Figure 24 uses OpenType stylistic alternates, and Figure 22 rotates the character **•**, in both cases preserving the plain text backing.

6.3 Other glyph variants not reflected in transliteration

TODO Comment on the nameless variant glyphs from L2/23-190 and note that they are illustrating an even wider glyphic range as shown in [Eng01].
