1 Summary

This document proposes encoding, at U+12550–U+12586, 311 numerals used in the fourth millennium (Uruk IV and Uruk III periods) and Early Dynastic period in conjunction with the Sumero-Akkadian cuneiform script¹ and the proto-cuneiform script². The proposed characters are listed in §2. Most of them were listed in [L2/23-190]. The present document provides a more detailed rationale for their encoding and additional information about their identity and usage, both as part of the rationale and in §5. Some characters have been removed, in some cases because they are non-encodable variants, in others because their encodability should be considered as part of the proto-cuneiform proposal; these are discussed in §6. The glyphs have also been reworked, and additional characters used in the Early Dynastic period have been added.

The non-numeric signs of proto-cuneiform will be the subject of a separate proposal; we need only note here that the divergence between the approaches to character identity in modern scholarship requires that proto-cuneiform be disunified from cuneiform: proto-cuneiform is effectively treated as an undeciphered script. In contrast, the cuneiform encoding model requires an understanding of the text to correctly encode it.

However, the *numerals* used in proto-cuneiform should be unified with ones used in the Early Dynastic period, for the reasons set forth in §4. The proposed “curved”, or “curviform”, numerals³ should however *not* be unified with the already-encoded cuneiform numerals⁴. Since the encoding proposals for the cuneiform script twenty years ago provisionally considered the curviform numerals to be

¹[ISO15924]: Xsux, Script property value long name: Cuneiform; encoded since Unicode Version 5.0.
²[ISO15924]: Pcus, not yet encoded.

³Impressed into clay using cylindrical stylus, held either perpendicular to the tablet, yielding • (small stylus) or ● (large stylus), or at a shallower angle: ▷, ▷ (small stylus), ▷, ▷ (large stylus). Some numerals are composed of multiple such impressions, e.g., ▷. The terms “curved”, “curviform”, “curvilinear”, and “round” can be found in the literature. We avoid the term “round” here as it has other meanings in the context of numbers. We use “curviform” in this document as, being the least common term, it is least likely to lead to confusion, and “CURVED” in the character names for consistency with documentation about the modifier @c used in machine readable ATF transliterations [Tim19].

⁴Impressed into clay using a stylus with a trihedral end: — (stylus held horizontally), | (vertically), \ (diagonally) < (with the head of the stylus), † (stylus pressed deeper, forming a larger wedge), ‡ (combining † and <), etc.

glyph variants of the cuneiform numerals, a detailed rationale is provided in §3, including compatibility considerations in §3.7.

The overall picture of unifications and disunifications over time is illustrated in table 1. The Script_Extensions property assignments in §2.3 reflect the overlap. Many of these numerals are also used in proto-Elamite⁵ texts, where they are treated as identical characters in scholarship on proto-Elamite, so that they should be unified with the ones proposed in [L2/23-196]. However, in the interest of time, we do not provide a detailed rationale for this unification in this document, and we are not proposing that the numerals be given the corresponding Script_Extensions property value for now. Neither do we propose encoding any numerals that are solely attested in proto-Elamite texts, or well-attested in proto-Elamite texts but insufficiently attested in Uruk—those are discussed in §6.

2 Proposed changes to the Standard

2.1 Core specification text

Amend [Uni16, §11.1.2, *sub “Cuneiform Numerals”*], as follows:

Cuneiform Numerals. In general, numerals that also have a phonetic, logographic, or determinative value are encoded in the main Cuneiform block; as a result, some series of numerals, such as 𒉩-𒉪-𒉪 1(diš)-9(diš) or 𒉢-𒉪 1(u)-9(u), are split across the two blocks. Numerals have been encoded separately from signs that are visually identical but semantically different etymologically unrelated (for example, U+1244F 𒌦 CUNEIFORM NUMERIC SIGN ONE BAN2, U+12450 𒌦 CUNEIFORM NUMERIC SIGN TWO BAN2, and so on, versus U+12226 𒌦 CUNEIFORM SIGN MASH, U+1227A 𒌦 CUNEIFORM SIGN PA, and so on).

The relation between series of numerals depends on the metrological system; for instance, when counting talents, written 𒉣 (a unit of weight, approximately 30 kg), 𒉣 is used for “one talent”, and 𒉣 for “ten talents”. However, when measuring areas, the area 𒉣 (one *bûrum*) is eighteen times 𒉣 (one *ikûm*, approximately 3600 m²). The Numeric_Value property assignment of a cuneiform numeral therefore reflects only its relation to the first numeral in its series, rather than the absolute numeric value that it might represent. For instance, the number “fifty” is written ៥, but U+12410 ៥ CUNEIFORM NUMERIC SIGN FIVE U has Numeric_Value=5, as it is 5 × ៥.

⁵[ISO15924]: Pelm, not yet encoded.

In the third millennium, and especially in the Early Dynastic period, some numerals are written using a cylindrical tool, rather than the cuneiform stylus, forming curved rather than cuneiform numerals (☞ rather than ↗). The cuneiform numerals are descended from these curved numerals. However, in the Early Dynastic period, the curved numerals contrast with the cuneiform ones, and are used together with them in several metrological systems; they are therefore separately encoded. Most curved numerals are encoded in the Archaic Cuneiform Numerals block, with the exception of two fractions in the Cuneiform Numbers and Punctuation block: U+1245D ☞ CUNEIFORM NUMERIC SIGN ONE THIRD VARIANT FORM A and U+1245E ☚ CUNEIFORM NUMERIC SIGN TWO THIRDS VARIANT FORM A, the curved counterparts of U+1245A ☜ CUNEIFORM NUMERIC SIGN ONE THIRD DISH and U+1245B ☝ CUNEIFORM NUMERIC SIGN TWO THIRDS DISH.

Add after [Uni16, §11.1.3]:

11.1.4 Archaic Cuneiform Numerals: U+12550–U+1268F

This block contains numerals used in the fourth millennium and third millennium. The numerals that are used in the fourth millennium and Early Dynastic I-II period (2900–2700 BCE) are named according to the conventions of the Berlin *Archaische Texte aus Uruk* (ATU) project, with names such as U+12550 ☞ CUNEIFORM NUMERIC SIGN ONE N01 or U+125B6 ☚ CUNEIFORM NUMERIC SIGN ONE N39A. For the signs that are also used in the third millennium, informative aliases provide correspondences to more common third millennium conventions, such as “1 as curved” for U+12550 ☞ CUNEIFORM NUMERIC SIGN ONE N01. The numerals that are only used starting in the Early Dynastic III period, where the ATU notation is not used, are named in the same fashion as the numerals of the Cuneiform Numbers and Punctuation block.

The curved numerals are produced using cylindrical tools of two different sizes, producing small curved indents (☞, ☚, and ☛), and large ones (☒, ☚, and ☝). These can be combined, as in U+12574 ☞☒ CUNEIFORM NUMERIC SIGN ONE N48, U+12582 ☚☒ CUNEIFORM NUMERIC SIGN ONE N50, or U+125A3 ☚☒ CUNEIFORM NUMERIC SIGN ONE N54. Consistent sizing is important to identifying these characters, as there is no visual distinction other than size between, for instance, U+12566 ☚☒ CUNEIFORM NUMERIC SIGN FIVE N14 and U+1257D ☚☒☒ CUNEIFORM NUMERIC SIGN FIVE N45. The reference glyphs of some of the larger signs have been resized to fit in the code charts cells, but fonts for these characters should retain consistent size across the numeral series.

Editor's note: I have not yet done that resizing. The dashed-box convention for wide dashes, see [Uni16, §24.1.2, sub “Dashed Box Convention”] should probably not be extended to these, since numbers enclosed in a real dashed box are a thing in proto-Elamite texts.

The Numeric_Value assignments follow the same principles as in the Cuneiform Numbers and Punctuation block. Numerals used in the third millennium have the Cuneiform script property value; numerals

used only in the fourth millennium have the Proto-Cuneiform script property value. Numerals used in both the fourth and third millennium have both scripts in their Script_Extensions values.

The sign ŠAR₂. When used logographically, the sign ŠAR₂ has the same (cuneiform) appearance as U+1212D ◇ CUNEIFORM SIGN HI in all but the most archaizing Early Dynastic texts. The character U+122B9 CUNEIFORM SIGN SHAR2 should be used for logographic šar₂, whether cuneiform or curved. Most period-specific fonts will have the same cuneiform glyph for U+122B9 and U+1212D. In the Early Dynastic period, numeric 1 šar₂ is typically written with a curved glyph, contrasting with logographic šar₂. U+12579 ● CUNEIFORM NUMERIC SIGN ONE N45 should be used for curved 1 šar₂. In later periods, long after ŠAR₂ and HI have merged, even numeric 1 šar₂ has a cuneiform glyph. U+122B9 CUNEIFORM SIGN SHAR2 should be used for cuneiform 1 šar₂.

The reference glyph for U+122B9 ● CUNEIFORM SIGN SHAR2 is curved, reflecting the rarer and more archaic practice, instead of cuneiform as it would be in the Ur III period, so as to distinguish it from U+1212D ◇ CUNEIFORM SIGN HI.

2.2 Code charts

The code charts for the proposed block, including the character names list with proposed informative aliases, cross references, and informative notes, are shown on the following pages. A plain text file containing the [NamesList.txt](#) lines is attached to this document.

This space for rent.

3 Rationale for curviform–cuneiform disunification

The numbering systems that use cuneiform numerals are descended from the ones that use curviform numerals, and many of the cuneiform signs have clear curviform counterparts across this transition. Co-occurrences are sometimes described by analogy to distinctions that are not the realm of plain text, as in [Pow72, p. 215] “in the same fashion as we use black and red ink”; however, we must bear in mind that such analogies are not made in the context of character encoding discussions. In 2004, the curviform numerals were deemed unencodable for the time being; however, closer inspection reveals that the distinction functions less like markup than was argued at the time, and that the unification is problematic.

3.1 The cuneiform encoding model

As outlined in, *e.g.*, [UTR56], the cuneiform encoding model is diachronic; each character may have wildly different glyphs depending on time period and region. For instance, the sign IM may resemble 𒂗 in texts from Early Dynastic IIIa Šuruppag as in the character code charts, 𒂗 later in the third millennium⁶, ܂ in Old Babylonian cursive, ܂ in Neo-Assyrian, but is always encoded as U+1214E CUNEIFORM SIGN IM.

This encoding model allows for the interoperable representation of editions of diachronic reference works such as sign lists⁷ and dictionaries⁸, and of composite texts⁹. By being compatible with similarly diachronic transliteration practice, *i.e.*, by avoiding distinctions finer than those made in transliteration, the encoding model also allows for automated conversion of transliterated corpora to cuneiform, which has proven useful as a processing step in analyses such as [Rom24; JJ24]¹⁰. The diachronic approach is also useful for pedagogic applications¹¹.

3.2 Arguments for curviform–cuneiform unification

In this context, the argument was made in [L2/04-099], as part of discussion of the cuneiform encoding¹² that the curviform numerals, which occasionally appear in the Ur III period and are used heavily in the Early Dynastic period, were a stylistic distinction unifiable with the cuneiform digits, and that an archaizing Ur III font or an Early Dynastic font could have curviform glyphs for the appropriate characters.

Some co-occurrence of curviform and cuneiform digits was known and acknowledged. [L2/04-099, p. 3] cites [NDE93, p. 62], which is a copy of [Po20054], an Early Dynastic IIIb administrative tablet from Nirsu. The excerpt cited, lines 1–3 of column 1 of the obverse, is as follows:

⁶Merging with U+1224E CUNEIFORM SIGN NI2.

⁷Notably [OSL] and the online edition of [Bori10] in [eBL, Signs].

⁸Notably [ePSD2] and the online edition of [Schio] in [eBL, Dictionary].

⁹For example, there are Neo-Assyrian and Neo-Babylonian copies parts of the laws of 𒄑–𠀤, as well as Old Babylonian copies in both archaizing and cursive styles. Because of damage on the stele [P249253], some sections are known only from those copies. See [Oel22, pp. 110 sqq.].

¹⁰Attendees may recall the summary given on the third day of UTC #180, as recorded in [L2/24-159]. Other readers may refer to [Svä+24, pp. 242, 148].

¹¹For instance, Old Babylonian grammar may be taught in the Neo-Assyrian script, as in [Cap02].

¹²At that time scoped to the répertoire of the Ur III period and later, see [L2/03-162, p. 1], although many disunifications, such as ܂ ≠ ܂, were informed by Early Dynastic distinctions.

1(neš₂)	1(u)	1/2(diš)	5(diš tenū)	gi	us₂	sa₂
7.5 (ropes)			5	reed	side	equal
3(u)	6(diš tenū)	gi	saj	sa₂		
3 (ropes)	6	reed	front	equal		
ašag=bi	1(bur₃c)	1(eše₃c)	1(ikuc)	1/2(ikuc)		
field=DEM ¹⁵						

tug_x(LAK 483)-si-ga-kam
tugsiga =ak =am -∅
ploughed=GEN=COP-3.SG.S

The argument made in [L2/04-099, p. 4] is that this is comparable to a stylistic distinction such as¹⁶

465 metres, equal lengths
198 metres, equal widths
this field is 9, 18 hectares of ploughed land

where the numerals have the same structure ([L2/04-099] contrasts this to the different structures of ASCII digits and roman numerals). That document further claims that “the number signs do not normally carry in their individual signs the meaning of what they are used to measure”, and that curviform and cuneiform numerals “are not normally mixed together in a single numerical expression”, noting the exceptions of [P232278; P232280]. In addition, [L2/04-099, p. 4] points out that the cuneiform numeric signs are descended from the curviform ones (this is undisputed), and claims there is only a small re-allocation of the function of signs (from ▷ to I numerals). It therefore comes to the conclusion that the use of curviform numerals should be seen as a formatting distinction, rather than one that should be represented in plain text, and insists that the encoding should capture the lineal historical descent of those signs, presumably to take advantage of the benefits of diachronic encoding described in §3.1.

Although they had been part of the preliminary proposal [L2/03-393R], the curviform numerals were therefore removed from [L2/04-036] and [L2/04-189], which both state that “The distinction between curved numerals and their cuneiform descendants is treated as glyptic for the purposes of the present proposal; this issue will need to be revisited in subsequent encoding phases¹⁷. ”

¹³As noted in [Pow87, p. 466], this sign has a very short “tail” in this period, so that it is wider than it is tall, and can at first seem like a large — in copies. The photos in [CDLI] clearly show that this is in fact a vertical wedge.

¹⁴Note that ED IIIb < numerals have a somewhat different appearance from those of the Ur III period used in this transcription; the sign << in [P020054] looks more like Ur III ✕.

¹⁵Alternatively: area=POSS.3.SG.NH, “its area”.

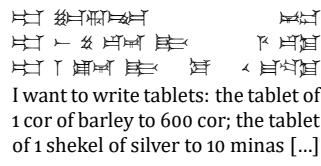

¹⁶We have taken the liberty of adjusting the analogy to use measures approximately equal to those in [P020054], instead of a field of five by twenty-five metres.

¹⁷The cuneiform encoding process was planned in stages in [L2/03-162]. One might expect the second stage of encoding, which led to the creation of the Early Dynastic Cuneiform block, to incorporate the

The time has come to revisit this issue. As we will see in §3.3, numerals can only be interpreted in the context of what they measure, *i.e.*, as part of a metrological system. In §3.4 we will see that in some periods:

- the functions and use of the numerals vary beyond the mere \square/I switch;
- the contrast between curviform and cuneiform numerals is commonly used to distinguish metrological systems;
- some metrological systems commonly mix curviform and cuneiform in single numerical expressions.

3.3 A primer on classic Ur III and Old Babylonian metrologies

Before diving into the usage of the curviform numerals in the Early Dynastic period to explain the contrast with cuneiform numerals, it is useful to understand the usage of the already-encoded characters in the Ur III and Old Babylonian periods.

As is well known¹⁸ a sexagesimal place value system (SPVS) was used in Mesopotamia from the late third millennium onwards. One should bear in mind, however, that other systems were used; the SPVS was primarily used in calculations, with results being expressed in non-positional systems [Robo8, p. 76; Rob22]. The digits 1–59 of the SPVS have inner structure which is reflected in the encoding: the digits 1–9 are the individual characters $\text{I}-\text{|||||}$, the multiples of ten (10–50) are $\leftarrow-\text{|||}$, but the other digits 11–59 are sequences $\leftarrow\text{I}-\text{|||}$; in effect the base-sixty digits are themselves written in base ten, with a different set of symbols for the tens place. This reflects the origin of the sexagesimal place value system; it derives from a *non-positional* system, hereafter the *cuneiform discrete counting system* $S_{\text{Ur III/OB}}$, which had different signs for the units $\text{I}-\text{|||||}$, tens $\leftarrow-\text{|||}$, sixties $\text{I}-\text{|||||}$ (with larger wedges than the units), multiples of six hundred $\text{K}-\text{|||}$, multiples of three thousand six hundreds $\diamond-\text{|||||}$, and multiples of thirty-six thousand $\diamond-\text{|||||}$.

3.3.1 The discrete counting system

The relations between the values of the signs in the cuneiform discrete counting system may be summarized by the following factor diagram¹⁹, where the number over arrow indicates the multiple of the preceding sign (right of the arrow) corresponding to the following sign (left).

$$\diamond \xleftarrow{10} \diamond \xleftarrow{6} \text{K} \xleftarrow{10} \text{I} \xleftarrow{6} \leftarrow \xleftarrow{10} \text{I} \quad (S_{\text{Ur III/OB}})$$

numerals needed for the representation and discussion of Early Dynastic texts; however, the proposal [L2/12-208] stated that “numerals have been omitted due to the complexity of numeral signs from this period. An expert in the metrology of this period must be consulted before these can be properly included.”

¹⁸See, *e.g.*, [Uni16, §22.3.3, *sub* “Cuneiform Numerals”].

¹⁹These diagrams, which have become standard in discussions of Mesopotamian metrology, originate with [Fri78, p. 10], where they are called *step-diagrams*, see Figure 4.

For example, the number $1729 = ((2 \times 10 + 8) \times 6 + 4) \times 10 + 9 = 28 \times 60 + 49$ would be written in the discrete counting system, and in the sexagesimal place value system.

3.3.2 The area system

The discrete counting system was not the only non-positional system in use in the Ur III and Old Babylonian periods; different systems were in use depending on what was being counted or measured. For instance, field areas were measured using the following system, where for the named units we have provided the name of the unit in transliterated Sumerian, normalized Old Babylonian Akkadian, and the approximate metric equivalent [Fri07, p. 378; Rob19]:

$$\diamond \leftarrow^{\text{10}} \diamond \leftarrow^{\text{6}} \ddagger \leftarrow^{\text{10}} \leftarrow^{\text{3}} \leftarrow^{\text{6}} \leftarrow^{\text{2}} \leftarrow^{\text{2}} \nearrow \quad (G_{\text{Ur III/OB}})$$

$būrum$
 $eblum$
 $ikūm$
 $ubūm$
 $6,48 \text{ ha}$ $2,16 \text{ ha}$ 3600 m^2 1800 m^2

Note that for the range of areas given above, this system does not use any symbols separate from the numerals for the individual units (*ubūm*, *ikūm*, *eblum*, and *būrum*). As mentioned in [Rob19], the whole numeric expression for the area would be followed by the sign functioning as punctuation²⁰, but the numerals are tied to the metrology; thus a surface of 5 *būr* 1 *ebl* 4 *ikū* (100 *ikū*, 36 ha) would be written²¹ . Contrast this with systems where the same numerals are used for different units, and overt units are used, as in “88 acres 3 roods 33 perches” or 五頃八畝五分九厘. Note also that the same signs are shared between multiple systems, with different relations; the sign is equal to sixty times in the area system, but to three hundred and sixty times in the discrete counting system.

For areas smaller than a quarter *ikūm*, an overt unit is used, with one (sar, *mūšarum*), approximately 36 m^2 , written , equal to one hundredth of an *ikūm*, then sexagesimally subdivided in 60 (*ginj₄*, *šiqlum*, “shekel”). For areas greater than 3600 *būr*, the and numerals are reused with a suffix (gal, “big”), as follows [Robo8, p. 295 nn. b, c; Fri07, p. 378; Rob19]:

$$\underbrace{\diamond \leftarrow^{\text{10}} \diamond \leftarrow^{\text{6}} \ddagger \leftarrow^{\text{10}} \diamond \leftarrow^{\text{6}} \ddagger \leftarrow^{\text{10}} \leftarrow^{\text{3}} \leftarrow^{\text{6}} \leftarrow^{\text{2}} \leftarrow^{\text{2}} \leftarrow^{\text{2,5}} \leftarrow^{\text{10}} \leftarrow^{\text{2}} \leftarrow^{\text{3}} \leftarrow^{\text{10}} \leftarrow^{\text{2}} \leftarrow^{\text{3}} \leftarrow^{\text{10}} \leftarrow^{\text{2}}}_{\text{---}} \quad (G_{\text{Ur III/OB}})$$

e.g., for $(2 \times 3600 + 20 \times 60 + 49) \text{ būr}$
 $5 \text{ ikū} (5 + \frac{1}{2}) \text{ mūšar} 19 \text{ šiqil}$. Factor diagrams in this document will use bottom curly brackets in this fashion to separate numerals from units and other suffixes.

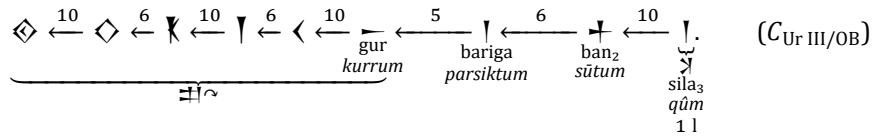

²⁰This sign is sometimes interpreted as a measurement unit, and transliterated *iku*, see, e.g., [Pro20, pp. 385 sqq.], or transcriptions in [Feuo4] discussed in §3.7.2. Even with this interpretation, the sequence of numerals used, and the interpretation of numerals shared with other metrological systems, is specific to system $G_{\text{Ur III/OB}}$.

²¹As in the surface of the field of (the city of Apisal) reported on [P102305, rev. 1]

²²From [P213162, obv. 2], which has an additional two thirds (of a shekel), see §3.3.5.

3.3.3 The capacity system

Another such system of note is the one for capacities²³ [Fri07, p. 376; Rob19],

In the above diagram, the numerals for ban_2 are + , ++ , ++ , ++ , and ++ , and those for bariga are I , I , II , and III (contrast ordinary I and III otherwise used with I numerals). Further, we have used the symbol \sim to express that, as described in [Hue11, p. 585 nn. (b), (f)], the sign ++ GUR, while it is used only with volumes in excess of one gur, is written after the whole expression, after the overt unit sign X if present, and after the word for “grain” if present, as in

3554 gur 3 ban_2 6 sila_3 of grain.²⁴

Observe that while large numbers of gur follow²⁵ system $S_{\text{Ur III}/\text{OB}}$, the use of horizontal ($A\check{S}$) numerals for the gur disambiguates from the vertical bariga, as $\text{<} \text{+} \text{+}$ would be 10 gur 1 bariga, and $\text{<} \leftarrow \text{+} \text{+}$ would be 11 gur; again even with some overt units, most of the numerals that participate in a metrological system have an interpretation dependent on that system.

This intertwining of units and numerals explains the large number of already-encoded numeral series:

- $\text{I}-\text{|||||}$ used in $S_{\text{Ur III}/\text{OB}}$ and the SPVS as well as with overt units;
- $\text{<}-\text{|||}$ used in $G_{\text{Ur III}/\text{OB}}$, of which $\text{<}-\text{|||}$ are also used in $S_{\text{Ur III}/\text{OB}}$ and the SPVS as well as with overt units;
- $\text{I}-\text{|||||}$ used in $S_{\text{Ur III}/\text{OB}}$, and sometimes with overt units;
- $\text{K}-\text{|||}$ used in $S_{\text{Ur III}/\text{OB}}$;
- $\text{O}-\text{◇◇◇◇◇◇}$ used in $S_{\text{Ur III}/\text{OB}}$ and $G_{\text{Ur III}/\text{OB}}$;
- $\text{◇}-\text{◇◇◇}$ used in $S_{\text{Ur III}/\text{OB}}$ and $G_{\text{Ur III}/\text{OB}}$;
- $\text{---} \text{+} \text{+}$ used in $C_{\text{Ur III}/\text{OB}}$ as well as with overt units of the weight system;
- $\text{+}, \text{++}, \text{++}, \text{++}, \text{++}$ used in $C_{\text{Ur III}/\text{OB}}$;
- $\text{I}, \text{I}, \text{II}, \text{III}$ used in $C_{\text{Ur III}/\text{OB}}$ —note the overlap with $\text{I}-\text{|||||}$;
- -- and -- used in $G_{\text{Ur III}/\text{OB}}$.

Only in the SPVS did numerals exist truly independently of metrology; to quote [Robo8, p. 78]: “The SPVS temporarily changed the status of numbers from properties of real-world objects to independent entities that could be manipulated without regard to [...] metrological system. [...] Once the calculation was done, the result was expressed in the most appropriate metrological units and thus re-entered the natural world as a concrete quantity.”

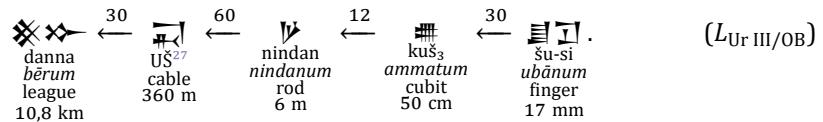

²³Used for volumes of grain, but also oil, dairy products, beer, etc., as well as to express the capacity of boats; volumes of earthworks instead use system $G_{\text{Ur III}/\text{OB}}$ based on a height of one cubit, see [Pow87, p. 488; Robo8, p. 294; Rob19].

²⁴From [P309594, obv. 1].

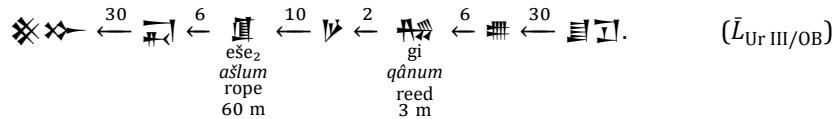

²⁵A larger unit, the guru₇ (*karûm*, grain heap), is sometimes used instead, with $\text{---} \text{◇◇◇◇◇} = \text{---} \text{+} \text{+}$ ($1 \text{ karûm} = 3600 \text{ kurru}$). See [Fri07, p. 415; Rob19].

3.3.4 The length system

In the Ur III and Old Babylonian periods, lengths are expressed using overt units counted with I and K numerals with their system $S_{\text{Ur III/OB}}$ values. Since it does not have any unusual numerals, this system would not in itself be of much relevance to character encoding, but we present it here as background for its Early Dynastic counterpart presented in §3.4. Metrological tables use the following units²⁶ [Fri07, p. 118; Rob19]:

Two more units appear occasionally [Pow87, p. 459; Fri07, p. 118; Rob19]:

In addition, there are Akkadian names for the half-rope and half-reed, see [Pow87, pp. 463 sq.].

3.3.5 Fractions

Fractions of the $ikim$, $\text{N} = \frac{1}{2}\text{—}$ and $\text{M} = \frac{1}{4}\text{—}$, have already been encountered. In other contexts, the fraction $\frac{1}{2}$ is written + , as in $\text{+} \text{+}$. The fractions $\frac{1}{3}$ and $\frac{2}{3}$ are written L and L . The latter two signs are derived from curviform signs P and E , which are already separately encoded; these are in turn derived from the sign I (SU_2), whose Early dynastic form resembles L , and O numerals; see [Pow71, pp. 113, 134]. The I is sometimes omitted, as in [P240545, *verso* 6 9; P221530; P221531; P271238; P274845].

3.4 Curviform numerals in early metrologies

At first sight, the metrological systems from the Early Dynastic period resemble the ones previously mentioned. In particular, the discrete counting system used in the Early Dynastic period (and earlier in the fourth millennium) clearly mirrors system $S_{\text{Ur III/OB}}$ [Fri07, p. 374; DE87, pp. 127, 165]:

Likewise the area system used in the Early Dynastic IIIB period for areas of one iku and greater [Dei22, p. 72; NDE93, p. 63; Fri07, p. 378; Lec16],

²⁶In this factor diagram and the next, we do not include the numerals. The units are no more than a factor of 60 apart, so higher numerals such as K or D are not used.

²⁷As indicated by the capitalization, the reading of this sign is unknown; see [Pow87, pp. 465 sqq.] for a discussion of various hypotheses.

mirrors system $G_{Ur\ III/OB}$ with consistent use of the numerals: • corresponds to \swarrow , ● to \diamond , and ○ to $\diamond\diamond$. An exception to this correspondence, noted in [L2/04-099, p. 4] (see §3.2), is that the vertical | from $S_{Ur\ III/OB}$ corresponds to a horizontal □ in system S . This is however far from the only case of such a reallocation of function. The earlier form of the area system is [DE87, pp. 141, 165; Fri07, p. 378]:

$$\bullet \xleftarrow{6} \circ \xleftarrow{10} \bullet \xleftarrow{3} \square \xleftarrow{6} \square, \quad (G)$$

Observe that, as noted in [DE87, p. 142], ○ changes meaning from $10\bullet$ in system G to $600\bullet$ in system $G_{ED\ IIIb}$. System G is used in the fourth millennium, but also in the ED I-II period (it is the “area 2” system in [Chao03], whereas $G_{ED\ IIIb}$ is the “area 1” system).

Another example of nontrivial correspondence between cuneiform and curviform numerals may be found by comparing the fractions the Early Dynastic IIIb area system²⁸,

$$\circ \xleftarrow{10} \bullet \xleftarrow{6} * \xleftarrow{10} \bullet \xleftarrow{3} \square \xleftarrow{6} \square \xleftarrow{2} \triangleright \xleftarrow{2} \triangleleft \xleftarrow{2} \blacktriangleleft^{29}, \quad (G_{ED\ IIIb})$$

with the numerals of a contemporaneous capacity system:

$$\underbrace{\square \xleftarrow{10} \square \xleftarrow{6} \bullet \xleftarrow{10} \square \xleftarrow{4} \triangleright \xleftarrow{6} \frac{1}{4}}_{\text{半-绳}} \quad (C_{半-绳})$$

both described in [Lec16]. While the size of the 半-绳 ($\text{gur saj } \eta\alpha_2$) in bariga is different from that of the Old Babylonian 半 , the basic structure of the capacity system is recognizable, with \triangleright corresponding to | for bariga, $\frac{1}{4}-\frac{1}{4}$ corresponding to $\frac{1}{2}-\frac{1}{2}$ for ban₂, and the 半 counted with □ rather than — numerals. However, the half-iku is counted with the same \triangleright as the bariga, whereas it uses a different sign, \nwarrow , in the Old Babylonian system. As we will see, this is cannot be handled as a split, by giving \nwarrow the glyph \triangleright in an Early Dynastic IIIb font, as the \nwarrow numeral series is also in use in that period.

3.4.1 Field lengths in Nirsu

The length system of the Early Dynastic IIIb state of Lagaš is of particular interest. As described in [Pow87, p. 466; Lec20, pp. 289 sq.], lengths are expressed in rods, but the unit sign V is generally omitted; in addition, only tens of rods are used; these are equal to one rope, but the sign I is not written either. Lengths shorter than one rope are expressed in half-ropes using the $\frac{1}{2}$ sign \perp (again with no I), and then in reeds, with the sign reed , as follows:

$$\begin{array}{c} | \xleftarrow{6} \swarrow \xleftarrow{2} \perp \xleftarrow{10} \nwarrow^{32} \\ \text{1 eše}_2 = 10 \text{ nindan} \\ \text{1 rope} = 10 \text{ rods} \\ 60 \text{ m} \\ \text{reed} \\ 3 \text{ m} \end{array} \quad (L_{ED\ IIIb})$$

This is the system that was used to express the sides of the field in [Po20054] discussed in §3.2. In that tablet and most others from the same period, such as the

²⁸A variant is $\circ \xleftarrow{10} \bullet \xleftarrow{6} * \xleftarrow{10} \bullet \xleftarrow{3} \square \xleftarrow{6} \square \xleftarrow{2} \triangleright \xleftarrow{2} \frac{1}{4} \xleftarrow{2} \blacktriangleleft$, see [Pow72, p. 218].

²⁹The (fairly rare) cuneiform counterpart is L .

³²The reeds are counted using *tenū* numerals, \nwarrow , \nwarrow^2 , etc.

ones discussed in [Lec20], areas are expressed in system $G_{ED\ IIIb}$, with curviform numerals³³; in the absence of overt units, such as when dealing with length that are integer multiples of a half-rope³⁴, the use of curviform or cuneiform numerals therefore disambiguates a numeric expression between an area and a length, and thus the interpretation of its numerals between systems $G_{ED\ IIIb}$ and $L_{ED\ IIIb}$. The sign 𒉗 , which would also disambiguate the interpretation as an area, is sometimes used after areas in ED IIIb Lagaš, but not systematically; in particular the area of the first field in [P020054] does not use this suffix. See [Lec20] for many examples with and without 𒉗 . There are other such co-occurrences contrasting between metrological systems; for instance, [Kre98, p. 303 n. 686] mentions the use of cuneiform numerals for days and months³⁵.

3.4.2 Dyke lengths in Nirsu

[Pow87, p. 466] notes that reeds “are regularly written with the normal, cuneiform end of the stylus. Higher units are usually written with the reversed (round) end of the stylus.” Powell does not elaborate on the specifics of this mixed use of numerals, but a cursory search in [CDLI] finds many occurrences³⁶, such as:

- [P221305, obv. 1 4]³⁷ $\text{𒃲} \text{𒃲} \text{•} = \text{𒃲} \text{𒃲} \text{•} \text{𒃲} \text{𒃲} \text{•} \text{𒃲} \text{𒃲} \text{•}$
- [P020129, rev. 2 1] $\text{𒃲} \text{𒃲} \text{•} \text{𒃲} \text{𒃲} \text{•} \text{𒃲} \text{𒃲} \text{•} \text{𒃲} \text{𒃲} \text{•}$
- [P221291, rev. 5 1]³⁸ $\text{𒃲} \text{𒃲} \text{•} \text{𒃲} \text{𒃲} \text{•} \text{𒃲} \text{𒃲} \text{•} \text{𒃲} \text{𒃲} \text{•}$
- [P221266, rev. 2 1] $\text{𒃲} \text{𒃲} \text{•} \text{𒃲} \text{𒃲} \text{•} \text{𒃲} \text{𒃲} \text{•} \text{𒃲} \text{𒃲} \text{•}$

These expressions use an explicit sign $\text{𒃲} \text{𒃲}$ (counted in multiples of ten) or 𒃲 . This notation—but not its use of curviform numerals—is remarked on in [Lec20, p. 290 n. 27], which cites several of the instances listed above. It seems to be typical of texts about dykes. The notation can be summarized by the following factor diagram, where prefix units have been marked by an asterisk:

$$\underbrace{\text{●} \leftarrow \text{○} \leftarrow \bullet}_{\text{𒃲} \text{𒃲}} = \underbrace{\text{○} \leftarrow \text{■} \leftarrow \text{○}}_{\text{𒃲} \text{𒃲}} \underbrace{\text{○} \leftarrow \text{■} \leftarrow \text{○}}_{\text{𒃲} \text{𒃲}} \underbrace{\text{○} \leftarrow \text{■} \leftarrow \text{○}}_{\text{𒃲} \text{𒃲}} \quad (L'_{ED\ IIIb})$$

3.4.3 Butter, cheese and wheat in Nirsu

A similar mixture of cuneiform and curviform numerals may be observed with the capacity system; indeed, the previously described $\text{𒂵} \text{𒂵} \text{𒂵}$ system uses

³³A [CDLI] search for "(bur3)" (numerals used for areas) currently returns 15 ED IIIb results, whereas one for "(bur3@c)" (\bullet numerals used for areas) returns 206. Further, when dated, the tablets with cuneiform bur₃ are from the reigns of (variously transliterated iri-inim-gi-na, uruk-gi-na, etc.) and (lugal-zag-ge-si), the last two kings of ED IIIb Lagaš.

³⁴This is the case of the sides of the field in [P020054, obv. 2 2–3].

³⁵That note also mentions a contrast between the use of curviform numerals to count people and curviform numerals to count bread allotted to them in [P010876]; such contrasts are more akin to styling, and might not, on their own, justify the disunification.

³⁶A search for curviform numerals followed by some number of reeds counted in (*tenū*) cuneiform numerals currently finds 125 occurrences across 47 tablets.

³⁷[CDLI] only has a copy, but a photo may be found in [Lec12, p. 82]. On that photo the is not visible. Lecompte notes that the copy is faithful; indeed another can be seen both on the copy and the photo on obv. 2 2.

³⁸From copy.

³⁹With either unit omitted, as in the examples above, or both, as in [P020129, obv. 3 3] $\text{DD} \text{::} \text{ }$.

numerals for X [Fri78, p. 43; Lec16]:

$$\underbrace{\bullet \leftarrow \square \leftarrow \square \leftarrow \bullet \leftarrow \square \leftarrow \square \leftarrow \square}_{\text{計量系}} \leftarrow \square \leftarrow \square \leftarrow \square \leftarrow \square \leftarrow \text{X}, \quad (C_{计量系})$$

as in [P020016, rev. 1 4; P020065; P020090, obv. 1 3, rev. 2 1; P020092, rev. 3 1; P020137, obv. 1 2] and others, where ban_2 counted with \square numerals are followed by sil_3 counted with X numerals. Curviform numerals are also used to count sil_3 , but not⁴⁰ as part of the \square systems. This contrast can be seen in [P220927], which measures butter (p , i_3) with a different capacity system, using the m (dug, “pot”) of 20 X , with \square and \bullet numerals⁴¹ for both the m and the X , thus [Pow87, pp. 504 sq.]

$$\underbrace{\bullet \leftarrow \square \leftarrow \square}_{\text{m}} \leftarrow \underbrace{\bullet \leftarrow \square \leftarrow \square}_{\text{X}} \leftarrow \frac{3}{2} \text{X} \leftarrow \frac{2}{3} \text{X}, \quad (C_{m})$$

but counts cheese (DX , ga’ar) using the \square capacity system, with X numerals for the X .

Another capacity system in ED IIIb Nirsu is the $\square \leftarrow \square$, the gur of two ul [Lec16]:

$$\underbrace{\bullet \leftarrow \square \leftarrow \square}_{\text{计量系}} \leftarrow \square \leftarrow \square \leftarrow \square \leftarrow \text{X}. \quad (C_{计量系})$$

Here the $\square-\text{X}-\square$ contrast occurs not only within the numerals of the system, but with its units; this is perhaps best illustrated by the expressions $\text{m} \leftarrow \text{m} \leftarrow \text{m}$ in [P221746, rev. 2 2] and $\text{m} \leftarrow \text{m} \leftarrow \text{m} \leftarrow \text{m}$ in [P221814, rev. 1 5].

3.4.4 Grain in Ebla

The mixing of curviform and cuneiform numerals within a metrological system is not specific to Nirsu.

⁴⁰As of this writing, the single occurrence of (banz@c) followed by curviform numerals and sila₃ in ED IIIb Nirsu transliterations on [CDLI], 4(banz@c) 3(asz@c) sila₃ in [P221815, obv. 4 7], is incorrect: it should be 4(banz@c) 3(disz@t) sila₃.

⁴¹This tablet also uses subtractive notation: $\text{m} \leftarrow \text{m} \leftarrow \text{m} \leftarrow \text{m} \leftarrow \text{m} \leftarrow \text{m}$ “two pots minus two thirds (sila₃)”, $\bullet \leftarrow \text{m} \leftarrow \text{m} \leftarrow \text{m} \leftarrow \text{m}$ “ten minus one pots, six sila₃”. Such subtractive notation is common in most of the metrological systems discussed here; it appears in the ED IIIa period [Robo8, p. 77]. It presents no complexity for character encoding, but it is noteworthy that the sign m (al, “minus”) is often ligated with the following numerals, with the subtrahend placed under a sometimes considerably enlarged m , similar to the layout of the radical in modern mathematical notation, see, e.g., [P020092, rev. 3 1, 2]. A good font could handle the very common -1 case, perhaps even -2 and -3 ; setting arbitrary numeric expressions under the m , or more generally replicating the layout of Early Dynastic tablets, is outside the realm of plain text; see also §6.3.

The system of grain⁴² capacities in Ebla uses the following units⁴³:

$$\text{𠀃} \leftarrow \text{𠁥} \leftarrow \text{𠁫} \leftarrow \text{𠁨} \leftarrow \text{𠁕} \leftarrow \text{𠁩}.$$

gu₂-bar ba-ri₂-zu giŋ₄ niŋ₂-sanšu an-zam_x

The 𠀃 and 𠁥 are generally counted using curviform numerals, and the smaller units using cuneiform 𒉌 numerals⁴⁴. Indeed, a search on [EbDA] for co-occurrences of either 𠁩 or 𠁨 with either of 𠀃 or 𠁥 finds the following expressions⁴⁵:

1. [P240532, verso 4 9] 𠁭 𠁥 𠁨 𠁣 𠁨 𠁣 𠁤 𠁧 𠁤 𠁣 𠁤 𠁨 𠁣
2. [P240548, verso 1 1] 𠁭 𠁥 𠁨 𠁣 𠁨 𠁣 𠁤 𠁩 𠁨
3. [P240655, recto 7 9] 𠁭 𠁨 𠁤 𠁧 𠁤 𠁨 𠁣 𠁨 𠁤 𠁤
4. [P240579, verso 4 3] 𠁭 𠁥 𠁨 𠁤 𠁨 𠁣 𠁨 𠁤 𠁨 𠁤
5. [P240675, verso 2 2] 𠁭 𠁥 𠁨 𠁤 𠁤 𠁨 𠁤 𠁤 𠁨 𠁤 𠁨 𠁤
6. [P240609, verso 3 1] 𠁭 𠁥 𠁨 𠁤 𠁤 𠁨 𠁤 𠁤 𠁨 𠁤 𠁨 𠁤
7. [P240533, recto 3 3] 𠁤 𠁦 𠁤 𠁥 𠁨 𠁤 𠁤 𠁨 𠁤 𠁤 𠁤 𠁨 𠁤 𠁤
8. [P240697, recto 1 5] 𠁤 𠁦 𠁤 𠁨 𠁤 𠁤 𠁨 𠁤 𠁤 𠁨 𠁤 𠁨 𠁤
9. [P240653, recto 6 2] 𠁤 𠁦 𠁤 𠁥 𠁨 𠁤 𠁤 𠁨 𠁤 𠁤 𠁨 𠁤 𠁨 𠁤
10. [P240654, recto 2 6] 𠁭 𠁥 𠁨 𠁤 𠁤 𠁨 𠁤 𠁤 𠁨 𠁤 𠁨 𠁤 𠁤
11. [P240531, recto 1 8] 𠁭 𠁥 𠁨 𠁤 𠁤 𠁨 𠁤 𠁤 𠁨 𠁤 𠁨 𠁤 𠁤
12. [P241708, recto 1 1]⁵² 𠁦 𠁤 𠁥 𠁨 𠁤 𠁨 𠁤 𠁨 𠁤 𠁨 𠁤 𠁨 𠁤
13. [P241904, recto 1 1]⁵³ 𠁭 𠁥 𠁨 𠁤 𠁨 𠁨 𠁨 𠁨 𠁨 𠁨 𠁨 𠁨

⁴²Liquid capacities use a different system [Arc15, p. 229 n. 12]:

$$\text{𠁵} \leftarrow \text{𠁦} \leftarrow \text{𠁨} \leftarrow \text{𠁩}.$$

la-ha sila₃ an-zam_x

A glance it seems that 𠁨 are counted with cuneiform numerals and higher units with curviform ones, thus

$$\overbrace{\text{𠁭} \leftarrow \text{𠁥} \leftarrow \text{𠁨}}^{\text{𠁵}} \leftarrow \text{𠁤} \leftarrow \text{𠁦} \leftarrow \text{𠁨} \leftarrow \text{𠁤} \leftarrow \text{𠁨} \leftarrow \text{𠁩}.$$

𠁵

but we have not investigated this thoroughly.

⁴³Another system uses different values for the 𠁨 and 𠁤, see [Chai12, p. 62; Arc15, p. 229 n. 12]:

$$\text{𠁭} \leftarrow \text{𠁥} \leftarrow \text{𠁨} \leftarrow \text{𠁤} \leftarrow \text{𠁨} \leftarrow \text{𠁤} \leftarrow \text{𠁨}.$$

⁴⁴As mentioned in [Chai12, p. 63], the 𠁨 is also counted using the 𠁤-𠁤 numeral series. Some instances of that usage are found transliterated *n/6* in [EbDA]; in some cases the 𠁨 sign is omitted, and the 𠁤 numeral is then written before the 𠁨 unit, as in 𠁤 𠁤 𠁨 from [P240545, verso 1 3].

⁴⁵We cite here only one attestation per tablet; most tablets contain several expressions mixing curviform 𠁥 and larger with cuneiform 𠁨 and smaller. In all cases the transcriptions given here are based on the [EbDA] transliterations, but the shape and orientation of the numerals was checked⁴⁶ on a photograph (from [EbDA] unless noted otherwise).

⁴⁶As we will see in §3.7.2, [CDLI] transliterations indicate numeral shape; however, as of this writing, they do so incorrectly on the Ebla corpus, claiming that all numerals are curviform, so we were not able to rely on them in this specific case.

⁴⁷ba-ri₂-zu₂, a variant spelling.

⁴⁸Short for 𠁭.

⁴⁹Note the omitted 𠁭.

⁵⁰Instead of the expected 𠁨.

⁵¹𠁨 not legible on the EbDA photo.

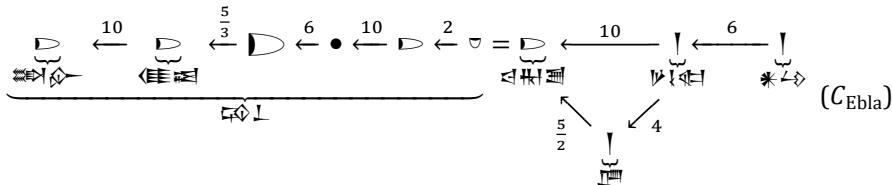

⁵²From [CDLI] photo.

⁵³From photo in [Arc89, p. 6].

⁵⁴Laid out as !!!!; on stacking patterns see §6.3.

14. [P240964, recto 3 2]⁵⁵ BBB 56 D o L ॥ * ॥⁵⁷

Note that higher numbers of L are expressed in hundreds (*mi-at* 𒂗 𒂔) and then thousands (*li-im* 𒂘 𒂔), as is typical in Ebla [Arc15, p. 33], e.g., in the last example above or in [P240532, verso 2 3], $\text{D} \text{BB} \text{BB} \text{L}$ (100 + 60 + 30 + 5 = 195 L of grain). These expressions correspond to the following factor diagram:

3.4.5 Use in modern publications

Because of their prevalence in the fourth millennium and Early Dynastic period, the proposed numerals are widely used in modern publications discussing metrology in those periods, as illustrated in Figures 1–21.

Since they contrast with the cuneiform numerals, they likewise appear contrastively in such publications. A remarkable example of that is found in Figure 21. The partial⁵⁸ transliteration “4 \square ’a₃-da-um 4 \square aktum 4 \square ib₂^{tu₀} \times 3! sa₆ gunu₃” is used to illustrate a discussion of the interpretation of the contrast between \square and \square numerals. More conventional transliterations might omit the numeral shapes entirely, e.g., 4 ’a₃-da-um 4 aktum 4 ib₂^{tu₀} \times 3 sa₆ gunu₃, which would obviously be inadequate in this context. There are transliteration conventions that are more explicit about numeral shape, e.g., 4(a^c) ’a₃-da-um 4(di^c) aktum 4(a^c) ib₂^{tu₀} \times 3(di^c) sa₆ gunu₃, but the result would be less readable. See §3.7.2 for a discussion of transliteration conventions for numerals.

for the words 𒊩 𒊩 𒊩 𒊩 and 𒊩 𒊩 𒊩 𒊩. Deimel's reading
 𒊩 𒊩 (a) for 0 came out of the reading /a n t a k/ for the
 sign T and the writing of 𒊩 a (- n a) after the fractional
 signs for 𒊩 𒊩 𒊩 𒊩 and 𒊩 𒊩 𒊩 𒊩 in Old Sumerian texts.
 But this was an ill-conceived argument at its inception, for

Figure 1: Discussion of the readings of proposed \square and already-encoded \square in [Pow71, p. 107].

⁵⁵From photo in [Arc89, p. 6]; see also the [CDLI] photo and the copy in [Fri86, p. 17]. This tablet features unusual usage of vertical numerals—“somewhat unorganized”, as described by [Fri86, p. 16]—, such as 𒂘 𒂔 or 𒂘 𒂔, but its ॥ * ॥ are consistently counted with cuneiform numerals, and the higher units with cuneiform numerals.

⁵⁶Short for 𒂘 𒂔.

⁵⁷ŠU₂+NIN₂-saŋ, an unusual variant spelling.

⁵⁸The untransliterated text would be BB 𒂘 𒂔 ॥ * ॥ BB 𒂘 𒂔 ॥ * ॥; note the atomically encoded ib₂ \times 3! = 𒂘 𒂔 \times 𒂘 𒂔 = 𒂘 𒂔.

sions also. In example 6, the writing ~~šanab~~ may imply a reading /š a n a b i/,¹ whereas ~~šanam~~ in example 11 should be read *-/š u š a n a m i n/. Moreover, the question must be raised as to whether such writings as <šu/> kù - b a b b a r + š a - a a² do not perhaps imply a linguistic resolution of *-/š u š a n a m i n/ rather than /š a n a b i/. I see no way of answering this question at present, but it is one which one

Figure 2: Discussion of the readings of proposed ~~šanab~~ and ~~šanam~~ as well as already-encoded \overline{v} and \overline{e} in [Pow71, p. 138].

iku fractions		
Girsu type	"BIN 8" type	Ur III type
$\square = :f.o.o$	$\Phi = :p.o.o$	$\text{I} = :m.o$
$\square = :o.g.o$	$\Theta = :o.q.o$	$\text{J} = :o.n$
$\Phi = :o.o.h$	$\text{G} = :o.o.r$	

Figure 3: A transliteration system for the fractions of the iku in [Pow72, p. 216].

¹ "big cup" = 3 "big disks". Hence we can infer from the two ŠE-texts BIN 8,⁴ and BIN 8,⁵ together, that the "ŠE-system" makes use of number signs whose values are related to each other through the equations

$$1\vartheta = 3 \circ, 1\circ = 10 o, 1o = 6 \text{v}, 1\text{v} = ? \text{q}$$

A more convenient way of saying the same thing is to write out the "steps" between the various ŠE-units in what we shall call a "step-diagram" for the "ŠE-system":

Figure 4: The first factor diagram, in [Fri78, p. 10].

$$\begin{cases} 4\textcircled{0} 5\textcircled{o} = 24\textcircled{0} 3\textcircled{o} & (\text{C } 234) \\ 5\textcircled{0} 1\textcircled{o} 1\textcircled{U} = 5\textcircled{0} 7\textcircled{o} & (\text{C } 314) \\ 1\textcircled{U} 1\textcircled{D}\textcircled{Q} 1\textcircled{D}\textcircled{Q} = 6\textcircled{o} 2\textcircled{U} 1\textcircled{D}\textcircled{Q} & (\text{C } 27). \end{cases}$$

These metrological equations for the "unknowns" $\textcircled{0}$, \textcircled{o} , \textcircled{U} , etc., can be treated exactly as ordinary equations for unknowns x, y, z, \dots . In particular, the equations can be simplified by subtraction of equal amounts from both sides of the identities. In this way the three equations above can be reduced to:

$$\begin{aligned} 2\textcircled{o} &= 20\textcircled{0} && (4\textcircled{0} 3\textcircled{o} \text{ subtracted from both sides}) \\ 1\textcircled{U} &= 6\textcircled{o} && (5\textcircled{0} 1\textcircled{o} - " -) \\ 1\textcircled{D}\textcircled{Q} &= 6\textcircled{o} 1\textcircled{U} 9\textcircled{D}\textcircled{Q} && (1\textcircled{U} 1\textcircled{D}\textcircled{Q} - " -) \end{aligned}$$

We can now read off from the first equation that $1\textcircled{o} = 10\textcircled{0}$, and from the second that $1\textcircled{U} = 6\textcircled{o}$. Then the third equation can be simplified (by "substitution" of these values into the equation), to the following reduced form:

$$1\textcircled{D}\textcircled{Q} = 2\textcircled{U} 9\textcircled{D}\textcircled{Q}.$$

The most likely solution to this last equation is, of course,

$$1\textcircled{D}\textcircled{Q} = 2\textcircled{U}, \quad 1\textcircled{D}\textcircled{Q} = 10\textcircled{D}\textcircled{Q}.$$

Figure 5: The derivation of the factors of the bisexagesimal system in [Fri78, p. 15]⁶⁰.

⁶⁰The bisexagesimal system is used alike in proto-Elamite and proto-cuneiform texts, see [Fri78, p. 38]; the derivation in [Fri78, p. 15] is based on proto-Elamite artefacts. There is a typo in the equation for C 27: the right-hand side should have $10\textcircled{D}\textcircled{Q}$ rather than $1\textcircled{D}\textcircled{Q}$, otherwise nothing could be deduced about $\textcircled{D}\textcircled{Q}$. Note that in Friberg's early works [Fri78; Fri79; Fri86; Fri87], copies of fourth millennium and sometimes third millennium tablets are shown as vertical text (which they were for the scribes), and their numerals are written within horizontal text in the same orientation that they have if the tablet is taken as vertical text; in [UAX50] parlance, as if they had Vertical_Orientation=Upright. In addition, they are listed in these equations in the horizontal order in which they appear as vertical text (thus the rightmost numeral is the most significant, read first). Cuneiform is correctly Vertical_Orientation=Rotated, consistently both with modern practice and with the rotation between earlier vertical and later horizontal monumental inscriptions. Friberg's early conventions are not followed in later scholarship, and are abandoned in his own more recent works, such as [Fri07]; a more typical way to express the first equations might be

$$\begin{aligned} 5\bullet + 4\textcircled{D} &= 3\bullet + 24\textcircled{D} && (\text{C } 234) \\ 1\textcircled{D} + 1\bullet + 5\textcircled{D} &= 7\bullet + 5\textcircled{D} && (\text{C } 314) \\ 1\textcircled{Z} + 1\textcircled{Z} + 1\textcircled{D} &= 10\textcircled{Z} + 2\textcircled{D} + 6\bullet. && (\text{C } 27) \end{aligned}$$

A diplomatic edition of [Fri78] could rotate the numerals using a higher-level protocol:

$$\begin{cases} 4\textcircled{U} 5\bullet = 24\textcircled{U} 3\bullet & (\text{C } 234) \\ 5\textcircled{U} 1\bullet 1\textcircled{U} = 5\textcircled{U} 7\bullet & (\text{C } 314) \\ 1\textcircled{U} 1\textcircled{D}\textcircled{Q} 1\textcircled{D}\textcircled{Q} = 6\bullet 2\textcircled{U} 1\textcircled{D}\textcircled{Q} & (\text{C } 27). \end{cases}$$

Thus, for instance, the original set of fractions v , o , and x ($1/2$, $1/4$ and $1/8$ of an iku) in the Sumerian CANA system, was after a time augmented through the addition of the new sub-unit SAR: S , equal to $1/10$ of an iku (\square). Similarly, the Sumerian weight unit "ma-na" which originally may have had only the sub-units v ša-na (= $1/3$ mana) and vv ša-na-bi (= $2/3$ mana), and perhaps also gin: vvv (= $1/60$ mana), seems to have acquired, at some time or other, also the smaller sub-units $\text{v}\text{v}\text{v}\text{v}$ (= $1/3$ gin), and $\text{v}\text{v}\text{v}\text{v}\text{v}$ (= $1/3 \times 1/60$ gin).

Figure 6: Discussion of proposed fractions v , o , and x , as well as already-encoded v and vv in [Fri78, p. 49].

stein publizierten Zeichenliste enthalten ist³, bis vor kurzem unentdeckt bleiben konnte. Erst 1978 machte der schwedische Mathematiker J. Friberg, ERBM I, 9-11, darauf aufmerksam, daß die Zeichen für die Zahlen Eins (\square) und Zehn (\bullet) in Verbindung mit dem Zeichen Š nicht im Verhältnis 1 zu 10 sondern im Verhältnis 1 zu 6 stehen. Bis dahin hatte man, obwohl die Andersartigkeit des in Verbindung mit dem Zeichen Š verwendeten Zahlzeichensystems bekannt war, für diese beiden häufigsten Zahlzeichen einheitlich ein Verhältnis 1 zu 10 unterstellt, obwohl es mehrere eindeutige Gegenbelege gab, von denen zumindest diejenigen der Archaischen Texte aus Gēmet Nasr bereits früh publiziert und jedermann zugänglich waren⁴. Als Folge

Figure 7: Discussion in [DE87, p. 117] of the discovery in [Fri78, pp. 9–11] (see Figure 4) of the different relations between \square and \bullet in systems G and \check{S} .

there is in any case an important qualitative difference between IX for Latin novem and \bullet for Sumerian niš. niš seems to be a primary numberword requiring, in a system depicting Sumerian numeration, a differentiated representation comparable

Figure 8: The sign \bullet used in a parallel with IX in [Eng88, pp. 131–133 n. 9], discussing an argument from [Pow72, p. 172] on the question of the language of the Uruk III texts.

of decreasing fractions $1/n$ of this measure, whereby "n" was determined by the number of oblique impressions made by the rounded end of a thin stylus around a central point in a specific sign. Thus $\text{v} = 1/2 N_{39}$, $\text{v}\text{v} = 1/3 N_{39}$, and so on. The first sign of the latter units, N_{34} ,

Figure 9: Description of the fractions v and vv in [Eng98, p. 113]⁶¹.

For instance, the first line contains the notations $1N_{34} 1N_{39} : 2N_{20}$, which can be translated "60 of the (grain rations containing) v (of grain); (grain involved:) 2 \bullet (of ground barley)". This calculation contradicts the assumed numerical relationship $10N_1 = 1N_{14}$, since as was well known the measure represented by the sign N_{39} was $1/5$ of that represented by N_1 , so that $60 \times 1/5 = 12$ and not 20, as $2N_{14}$ would imply. Instead of relying on complicated

Figure 10: The sign v used as a capacity measure within otherwise translated text in [Eng98, p. 116].

⁶¹The text erroneously has N_{34} instead of N_{24} .

Die halbkreisförmigen Griffelindrücke gehen manchmal in mehr oder weniger eckige Formen über (¶)⁶⁸⁵. Es gibt aber auch Einer in Form von regelrechten – meist mehr oder weniger schräggestellten – Keilen (＼), die öfters neben halbrunden Einern vorkommen und mit diesen kontrastieren⁶⁸⁶. Seltener treten mit ◻ gebildete Zahlen auf⁶⁸⁷ (sie entsprechen den bariga-Zahlen im Hohlmaßsystem, s.u. 7.4).

Figure 6. Transliteration and calculations of *MSVO 4*, 66.

Figure 12: Calculations from [Poo5468] transcribed in [Eng01, p. 132] using modern mathematical notation combined with some of the proposed characters.

strong similarities between “area” 1 and “area” 3 systems, the sign with two concentric discs (◐, notated N₅₀²⁷) remains problematic. It never appears in any numerical combination with the sign with a single disc (●,

Figure 13: Discussion of ◐ and ●⁶² in [Cha03, p. 6].

⁶²The statement that these do not co-occur refers to the texts from ED I-II Ur; these signs co-occur both earlier and later in areas, with different relations as previously discussed.

$\frac{1}{15}$, etc., of gur, we would expect the metrogram gur to appear in sub-column ii. In a certain way, it does for larger measures: the notation $\text{I} \text{ } \text{I}\text{I}\text{I}$ could be understood as $1 \frac{1}{3}$ gur.²⁷ However, the metrogram gur does not appear for lower measures. It would not be consistent to attribute different functions to the same grapheme, according to the relative importance (be it great or small) of the quantity, so the signs I and III cannot be considered klasmatograms.

Metrological tablets from the end of the 4th millennium (Nissen, Damerow and Englund 1993, 55-59, to *MSVO* 1, nos. 2-3) contain a discrete set of numerical signs with specific surface area reference:

- 1(iku) represents a surface of 3600m^2
- ▢ 1(esē₃) represents a surface of $21,600\text{m}^2$
- etc.

The signs iku and esē₃ constitute by themselves measures of surface areas. These measures are usually followed by the sign GAN₂, which means either surface or field and

Figure 14: Discussion of Old Babylonian⁶⁴ capacity and fourth millennium area measures in [Pro09, p. 9].

formed by only two signs I and L , repeated as many times as necessary; this type of notation is highly standardized. Second, the order of magnitude of the numbers noted in this system is not indicated: $1, 60, 60^2, 60^3, 1/60, 1/60^2$, etc. are written in the same way, with the vertical wedge I . The third feature concerns the exact function of

Figure 15: Description of the SPVS in [Cha12, p. 58], using the already-encoded signs I and L .

one step. The scribes of the Early Dynastic Period (c. 2600 BC), for instance, represented the number 648,000 with: □●●● but never with the repetition □□●●●.

Figure 16: Discussion of large numbers illustrated by □●●⁶⁵ in [Cha12, p. 59]

repetition of the same sign refers to both the capacity unit signified—often but not necessarily written immediately afterwards—and its value. The units of measurement are written in descending order from left to right—just as we would write 3 km, 120 m, 50 cm. For example:

□□□ še bar □ *ba-ri-zu*

'3 gubar (capacity units) and 1 *parisu*'.

Figure 17: Partial transliteration of [P240597, recto 5 3] □□□ □□ □ L □ □ □ in [Cha12, p. 61].

⁶⁴The cuneiform text is Unicode-encoded.

⁶⁵Compare □□ in system *G_{Ur III/OB}*. Sign order can be variable in early texts, see [Fox16, p. 8]. See [P010773], also discussed in [Fri07, p. 148], for an example of □●, and [P274845; P241764] for examples of n●□.

This is particularly true of the signs and , whose form explicitly denotes the fractions $1/6$, $2/6$, $3/6$, and $4/6$ of the barig capacity measure written in Mesopotamia—also transcribed by Assyriologists as 1 bán, 2 bán, 3 bán, and 4 bán with reference to the bán measure worth $1/6$ of the barig. At Ebla, the sign is most often associated with the *parisu* measure, while the signs and

Figure 18: Discussion in [Cha12, p. 64] of the relation between and in Mesopotamia and in Ebla.

shape. The principle of notation is additive: each sign is noted as many times as necessary (e.g., transliterated as $2(\text{šar}_2) 1(\text{geš}'\text{u}) 3(\text{u})$, means $2 \times 3600 + 1 \times 600 + 3 \times 10$). The system is based on an alternation of factors ten and

Figure 19: Explanation of the structure of the number in [Pro20, p. 350].

might think of one fabric and a half,¹¹ but the presence of notations with “ $2\blacktriangleright 2\blacktriangledown$ ”, “ $3\blacktriangleright 3\blacktriangledown$ ”, and “ $6\blacktriangleright 6\blacktriangledown$ ” (Fig. 1) elements excludes that one deals with fractions, as these notations are not consistent with those of Šuruppag’s weight measurement system.¹² The notation “ $1\blacktriangleright \text{gada}$ ” in o. ii 1 and r. vi 1, along with the total of “39

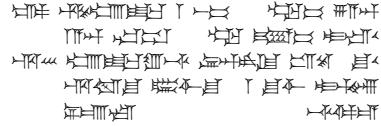

Fig. 1. Combinations of numerals attested in Š. 742.

Figure 20: Discussion of the contrast between and numerals in [Gor23, p. 162].

as, for example, in TM.75.G.3125 = ARET III 107 o. iv 1, “ $4\blacktriangleright \text{a}_3\text{-da-um}^{\text{tu}9}\text{-}2 \wedge 4\blacktriangledown$ aktum $4\blacktriangleright \text{ib}_2^{\text{tu}9}\times 3\text{ } \text{T sa}_6 \text{ gunu}_3$ ” (Fig. 2).

Figure 21: Transliteration in [Gor23, p. 163] of [P242293, *recto* 4 1] incorporating untransliterated numerals.

3.5 Non-numeric usage

The beginning of the scribal art is a single wedge. That one has six pronunciations; it also stands for 'sixty'⁶⁶. Do you know its reading⁶⁷?

Examenstext A

Many of the cuneiform numerals are used with a logographic or phonetic value. For example, the sign — has, *inter alia*, the values aš, rum, and dili. While the horizontal numerals are most frequently written ▷ in the Early Dynastic period⁶⁸, such non-numeric usage is almost⁶⁹ always written —, for instance:

- in personal names in administrative texts, such as the following, which all contain ▷ numerals:
 - — in [P010424, rev. 1 5; P010458, obv. 1 5; P010459, obv. 2 5'] from ED IIIa بُو صَلَيْخ,⁷⁰
 - — in [P010960, obv. 2 5] from ED IIIa Šuruppag,
 - — — in [P251641, obv. 4 3] from ED IIIb Adab,
 - — — — in [P252866, rev. 2 3] from ED IIIb Adab,
 - — — — — in [P298637, rev. 2 4] from ED IIIb Umma;
- in the Sumerian word — u₂-rum, "property" in ED IIIb Njirsu administrative texts which contain ▷ numerals, such as [P020006, obv. 2 3; P020008, rev. 1 2; P020018, rev. 1 2; P020024, obv. 1 4; P020030, obv. 3 1];
- in lexical texts:
 - in the divine name — — — — — in the lexical texts [P010570, rev. 2 4; P010572, obv. 3 6], where the entries are prefixed with ▷.
 - in the word — dili, "small fish" in [P010578, obv. 2 5], witness to Early Dynastic Fish,
 - in the same word with a determinative, — — dili^{ku₆}, in [P010586, obv. 4 4, 6], witness to Early Dynastic Food, which starts with ▷ numerals.

This is a clear contrast between — and ▷ in this period, and genuine ambiguity can arise if it is lost; for instance, the personal name — — occurs on its own line in the aforementioned administrative texts; a line ▷ — would instead be read as "one slave".

3.6 The limited benefits of diachronic encoding for numerals

The argument in favour of diachronic encoding is that it facilitates interoperability in a variety of use cases, as we have outlined in §3.1. While these benefits are real and

⁶⁶The reader will recall that ḫeš₂ is written 𒈗, with a larger wedge than 𒈗; however, these signs have merged by the time Examenstext A is composed.

⁶⁷Besides ḫeš₂, a look at [OSL] shows that the values diš, ge₃, makkaš, santak₄, and tal₄ are attested both in [ePSD2] and in lexical lists. The sign is also used for the Akkadian word *ana* in the Neo-Assyrian period.

⁶⁸A [CDLI] search for "(asz@c)" finds 3296 ED texts, while a search for "(asz)" finds 81 ED texts, of which 46 also contain "(asz@c)".

⁶⁹Exceptions are discussed in §3.7.1.

now visible for cuneiform signs, similar considerations are not generally applicable to curviform numerals.

Diachronic reference works such as sign lists and dictionaries tend to not include numbers, or when they do, they treat them separately, and include signs such as — that have both numeric and non-numeric values in both the main list and the section on numbers. For instance, [Sch35, pp. 123 sqq.] lists all of —— together with ▷-BBBBP, while —, ↔, and ↔↔, and only those, appear at the beginning of the sign list, since they have non-numeric values⁷⁰. [Cat13, p. 58] has the numeric signs ▷, ↗, !, whereas non-numeric — is at the beginning of the sign list, where its values *aš* and *rum* are listed. For signs with both non-numeric and numeric usage, [Dei22] writes *s. die Zahlz.* throughout the main list; LAK 1 — thus reappears at LAK 829 together with ▷, ↗, and !. One should note [Bor10], which has numbers throughout the sign list; but that sign list does not show glyphs predating the Old Babylonian period, nor does it comprehensively cover the numerals used in the Ur III and Old Babylonian periods, as, for instance, it does not have 𒃩-𒃩 used in system *G_{Ur III/OB}*.

Composite texts rarely have witnesses both from the Early Dynastic period and later; the kinds of texts that do, chiefly lexical and literary texts, do not contain numbers to the extent that administrative texts do. Further, there tend to be changes⁷¹ to the text between Early Dynastic and later witnesses that prevent a diachronic encoding of such composites. For numerals, the switch from ▷ to ! numerals prevents diachronic encoding even if ▷ were unified with —. For instance, the lexical list Early Dynastic Food, already mentioned in §3.5, contains some numbers, and has a witness from the Old Akkadian period covering these numbers: [P215653, a 1'-6']; however, they are written with ! numerals, whereas they are written with ▷ numerals in the Early Dynastic witnesses; since ! and — are distinct⁷² characters, the ▷-— unification does not help.

More generally, since numbers are so deeply tied to metrology, and since metrological systems change between the Early Dynastic and later periods⁷³, there is little opportunity for a diachronic representation of numeric quantities.

In the case of analyses such as [Rom23, *sub “Adding Corpora”*], it is interesting to note that numeric expressions are removed prior to the conversion of the corpus to Unicode cuneiform for further analysis.

⁷⁰Non-numeric values of — were discussed in §3.5; ↔ has the values *man₃* and *min₅*, and is used for the word *didli*, “several, various”; ↔↔ has the value *eš₆*.

⁷¹Compare, e.g., in the *Instructions of Šuruppak*, 𒃩 𒀭 𒈚 𒉢 𒉣 𒉦 / 𒉦 𒉚 𒉣 𒉦 in the ED IIIa witness [P222243, obv. 2 7], also discussed in §3.7.4, and 𒃩 𒀭 𒈚 𒉢 𒉦 𒉚 𒉣 𒉦 𒉚 𒉣 𒉦 in the OB composite [Q000782, 6] (translated “Šuruppak gave instructions to his son” in [ETCSL, t.5.6.1, 1-13]). It does not matter for the construction of a composite text whether this is encoded 𒉣 𒉦 or 𒉣 —, since that word is absent from other witnesses, and since the surrounding words differ.

⁷²Besides the contrasts in numeric usage mentioned in §3.3.3, these (already-encoded) characters were clearly not unifiable because of the many contrasts in non-numeric usage between them; several values of — which are not shared with ! have already been mentioned, but perhaps most striking is the fact that, in the Neo-Assyrian period, — is used for the preposition *ina*, “in”, and ! for the preposition *ana*, “to”.

⁷³See, e.g., [Pow87, p. 493; Robo8, p. 55] on the unification of metrologies in the Old Akkadian period, resulting in the systems described in §3.3.

3.7 Compatibility considerations

A disunification twenty years after the fact, affecting all numerals, would ordinarily be a serious compatibility issue. Fortunately, with the exception of one character discussed below, we are not aware of any font using curviform glyphs for the already-encoded numerals. In fact we are not aware of any font designed for a style earlier than Old Babylonian, except for fonts mimicking the representative glyphs from the code charts, which are primarily Ur III, but sometimes earlier or later, as described in [UTR56, §2.4]. The lack of dedicated Ur III fonts may be explainable by the chart-like fonts⁷⁴ being good enough for most purposes; the lack of Early Dynastic fonts, by the aforementioned issues with numeral unification making the representation of any text with numerals intractable.

3.7.1 The case of ŠAR₂

The character U+122B9 ● CUNEIFORM SIGN SHAR2 has a circular reference glyph.

In most texts from the Early Dynastic IIIb and Old Akkadian period⁷⁵, a contrast between non-numeric šar₂ written ◇ and numeric 1(šar₂) written ● can be observed, similar to the contrast between — and ▷ previously discussed in §3.5. However, in lexical lists from Šuruppag and Ebla⁷⁶, as well as in the *Stèle des vautours*, non-numeric šar₂ is curviform:

- * 𒂗 𒀭 ● and * 𒂗 𒀭 ● 𒀭 in [P010566, obv. 10 10, 11];
- ● 𒀭 and * ● 𒀭 in [P010576, rev. 3 16, 17];
- ● 𒀭 in [P240986, recto 3 3]⁷⁷;
- ● 𒀭 in [P222399, obv. 17 9, 18 11, 22 12]⁷⁸.

It would be disruptive to the diachronic representation of text if non-numeric šar₂ were to have two different representations. The character U+122B9 CUNEIFORM SIGN SHAR2 should therefore be used in those cases, with its curviform glyph ◇, identical to the glyph of the proposed U+12579 ● CUNEIFORM NUMERIC SIGN ONE N45. Since the archaizing style of texts wherein non-numeric šar₂ is curviform solidly predates the transition from ● to ◇ in the relevant metrological systems, there is no need to represent a ◇-● contrast, so these characters can have the same glyph in specialist archaizing Early Dynastic fonts.

Since cuneiform U+122B9 CUNEIFORM SIGN SHAR2 effectively merges with U+1212D ◇ CUNEIFORM SIGN HI, the reference glyph should remain as it is, *i.e.*, curviform, so that the contrast between reference glyphs within the Cuneiform block remains clear; see [UTR56, §2.4]. Since system fonts follow the reference glyphs, and since extant specialist fonts target styles where U+122B9 is unambiguously cuneiform, there are no compatibility issues.

⁷⁴Most prominently Noto Sans Cuneiform, a system font on both Windows—as part of Segoe UI Historic—and macOS.

⁷⁵For example, in personal names:

- 𒈗 𒀭 ◇ 𒉩 in [P020019, rev. 1 2] from ED IIIb Njirsu;
- 𒈗 𒄑 ◇ 𒉩 in [P020182, obv. 2 9], also from ED IIIb Njirsu;
- 𒁶 * ◇ in [P222186, obv. 3 3] from ED IIIb Umma;
- 𒉩 * 𒄑 ◇ in [P235312, obv. 16] from Old Akkadian Umma.

⁷⁶These are archaizing in other ways, *e.g.*, they have a 𒉩-𒉩 (NAM₂-TUG₂) split.

⁷⁷From copy in [Man81, ELles 397].

⁷⁸Note however * 𒉩 ◇ 𒉩 on [P222399, obv. 6 17], see Figure 22. Curviform non-numeric šar₂ is clearly archaizing in ED IIIb Njirsu; one might suppose that the scribe slipped into their modern ways here.

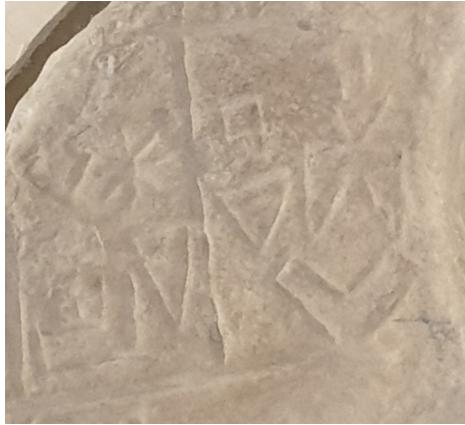

Figure 22: [P222399, obv. 6 16–17] 𒉿 𒈚 𒈗 𒉣 𒈗 𒉦 𒉦 𒉦 / 𒀭 𒉤 𒉤.

Note that in rare cases, such as [P222243, obv. 2 7] from ED IIIa Adab, non-numeric — (here with the value rum) is written ▷. It is out of scope for this proposal to decide whether such occurrences should be treated as anomalous spellings, encoded as U+12550 ▷ cuneiform numeric sign one N01, or as stylistic distinctions, encoded as U+12038 CUNEIFORM SIGN ASH with a curviform glyph. In practice this would often be determined by the transliteration from which the cuneiform text is generated; it is noteworthy that as of this writing, the [CDLI] transliteration (UR2-1(aš@c)) and the [ePSD2] one (uru₈^{rum}) of this word disagree on that aspect. Since — has a cuneiform reference glyph, this does not pose any compatibility concerns.

3.7.2 Transliteration

An important feature of the encoding is that, in order to support input and bulk conversion of transliterated corpora to Unicode cuneiform, it should not represent distinctions that are finer than those recorded in typical transliterations; thus, while some older forms of BIL₂ can be described as 𒉿 𒈚 𒈗 NE×KASKAL or 𒉿 𒈚 𒈗 NE×PAP⁷⁹, they are typically all transliterated bil₂, and therefore are all represented by the character U+1224B 𒉿 CUNEIFORM SIGN NE SHESHIG, its name notwithstanding, as described in [UTR56, §2.5].

The situation is more complicated for numbers. Many transliterations do not represent the type of numeral used, instead interpreting the whole numeric expression and transcribing it with delimiters or units as needed to disambiguate. For instance, 𒉿 𒈚 𒈗 from [P305639, rev. 21] may be transliterated as 95 gur, as in [Feu04, vol. 2, p. 62]. The numerals may also be transliterated separately, but solely by their values in terms of the overt unit, as in [EbDA] transliterations: the aforementioned 𒉿 𒈚 𒈗 𒉿 𒈚 𒈗 𒉿 𒈚 𒈗 𒉿 𒈚 𒈗 𒉿 𒈚 𒈗 from [P240533, recto 3 3] is transliterated “20-1-1/2 gu₂-bar 7 nig₂-sagšu 2-1/2 an-zam_x⁸⁰ za”, reading both 𒈚 and 𒈗 as 1/2, but not distinguishing them.

⁷⁹As on [P249253].

⁸⁰As of this writing, [EbDA] actually has an-zam_x, with U+1D6A GREEK SUBSCRIPT SMALL LETTER CHI.

In particular, these transliterations do not differentiate between — and ! numerals, nor between \square and \triangleright numerals. For instance, the aforementioned [P242293, *recto 4 1*] is transliterated “4 $\text{'a}_3\text{-da-um}^{\text{tug}_2}$ -II 4 aktum $^{\text{tug}_2}$ 4 ib $_2$ -III gun $_3$ sa $_6$ $^{\text{tug}_2}$ ” in [EbDA], with no distinction between the and . Since — and ! numerals are separately encoded, the numeric expressions in such transliterations cannot be transformed into Unicode cuneiform without additional context, regardless of curviform–cuneiform unification.

In metrological systems such as systems $G_{\text{Ur III/OB}}$ and $C_{\text{Ur III/OB}}$ where some units are indicated by the type of numeral rather than an overt unit sign, it is common practice to add the unit in parentheses in transliteration; for instance, from [P386847, obv. 1] is transliterated “1(es $_3$) 5½ iku⁸¹ 7 sar” in [Feu04, vol. 2, p. 176], and from [P307255, obv. 12] is transliterated “1(n⁸²) 2(b) 7 ½ sila $_3$ ” in [Feu04, vol. 2, p. 151].

This practice has been generalized to systematically indicate numeral shape; this is in particular the case in [CDLI], where the transliterations of some the above examples are “1(geszz) 3(u) 5(asz) gur” for $\text{!}\triangleleft\triangleleft\triangleleft\triangleleft$, “1(esze $_3$) 5(iku) 1/2(iku) GAN2 7(disz) sar” for $\text{—}\triangleleft\triangleleft\triangleleft\triangleleft$, and “3(barig) 2(ban2) 7(disz) 1/2(disz) sila $_3$ ” for . [CDLI] and [ePSD2] both distinguish curviform from cuneiform numerals in transliteration: the length from [P020129, rev. 2 1] is transliterated “6(geszz@c) 3(u@c) {ninda}nindax(DU) 1/2(asz@t) 4(disz@t) gi” in [CDLI], and “6(geš $_2$ c) 3(u c) ninda{ninda}_x(DU) 1/2(aš c) 4(diš t) gi” in [ePSD2]. Another example is [Mol14, p. 39], which uses 1a for — , 1d for ! , 1ac for \square , 1dc or ½dc for \triangleright depending on reading, etc. The literature on the Uruk and Early Dynastic I-II periods uses a different set of transliteration conventions that also disambiguate numeral shapes, as will be discussed in §4.

While there exist transliterations that distinguish — from ! but not from — , such as the ones used in [DCCMT], the trend, especially in more recent works in third millennium studies, seems to be to represent numeral shape; for example, [MV24] gave an example of the input syntax used by the new “Urban Economy Begins” project as “10 + 5c(GUR) + 2(BARIGA) + 1(BAN2)” for •!, with a c indicating that the GUR numerals are curviform, and the parenthetical GUR indicating that these are \square rather than \triangleright numerals. The “tradition of cavalierly dispensing with numerical notations in notations of administrative documents”, as [Eng04, p. 30] describes it, seems to be fading.

3.8 Conclusions

Co-occurrences of curviform and cuneiform numerals are not anecdotal in the Early Dynastic period, nor are they the result of scribal idiosyncrasy. Instead, they represent systematic contrasts between metrological systems, between individual units within metrological system, and between numeric usage and phonetic or logographic usage. This contrastive usage is reflected in modern publications. The contrast frequently applies to individual numerals, rather than to the span of entire numeric expressions.

While it would be technically possible to handle this contrast as a stylistic distinction, this approach has no real benefit, and is highly inconvenient, as it would require any treatment of Early Dynastic administrative texts to use multiple

⁸¹ interpreted as a unit, as discussed in §3.3.

⁸² short for nigida, an older reading of bariga; see [Lan50, p. 376; Pow75, p. 181; Fox22, p. 9].

cuneiform fonts, often within single numeric expressions. Further, if that contrast is lost in plain-text interchange, the text can be misinterpreted: « is a length of three ropes, but ♦• is an area of three bur₃; ▷! could be read as one ◇◁ L and one ▷▷! where ▷▽ would be one and a half ◇◁ L; —! is a personal name, but ▷! would be “one slave”.

In addition, there would be a risk of confusion about character identity should fontmakers attempt to treat the curviform and cuneiform numerals as unified. A designer concerned about the numeric-syllabic ▷— contrast, and wishing to support diachronic encoding between systems *S_{Ur III/OB}* and *S*, might give the ! numeral series (which is typically only used numerically in the Early Dynastic period) the glyphs of the ▷ numeral series, since the clear ▷-▷ identification involves the same rotation; this would however make it impossible to represent capacity measures that use ▽. Similarly, in an effort to support diachronic encoding for 1/2(iku), one might be tempted to give ↗ the glyph of ▽, thereby rendering the font unusable for quantities measured using the ↗ numeral series; an ED I-II Ur font designer could decide to give ↘ the same glyph as ◇ (that of the proposed ●), according to the older area system, making it impossible to represent the newer system.

At the same time, contrary to most disunifications, the separate encoding of curviform numerals poses no serious compatibility issues for existing fonts or encoded corpora, nor does it, in general, introduce new issues with transliterated third millennium corpora. The oddity of ● requires some explanation, but does not pose any architectural issues, and is not fundamentally different from the other mergers and splits encountered in the cuneiform script.

4 Rationale for ED-Uruk numeral unification

A complete rationale for disunification between the non-numeric signs used in the fourth millennium and the already-encoded cuneiform signs will be given in the forthcoming proto-cuneiform encoding proposal. The core issue with extending the cuneiform script further back in time is that, since 1987, fourth millennium studies have used a different model of character identity and associated transliteration conventions, with names being given to structurally different glyphs, and no attempt being made at assigning phonetic values to them.

This is not a mere classification of glyph variants, as contrastive meanings of these systematic variants can often be reconstructed, with, *e.g.*, signs KAŠ_a, KAŠ_b, and KAŠ_c, depicting filled jars with a spout (a), a handle (c), or neither (b), being understood as referring to containers of different substances, see [Eng01, pp. 34 sq.]. However, not all identified systematic variants are understood, and the general approach to character identity is closer to that used for undeciphered or partially deciphered scripts.

As part of the development of these conventions, a classification of fourth millennium numeric signs was developed; see [DE87]. This classification assigns to each unit numerals an identifier formed by the letter *N* with a numeric subscript (sometimes with an additional alphabetic subscript): *N*₁ is ▷, *N*₁₄ is •, *N*₃₄ is ▷▷, etc. Transliterations of numeric expression then use those to identify the type of number used, thus 5*N*₁ is BBP, and 5*N*₁₄ is ♦••.

In contrast with the use of parenthetical unit names, this approach does not require interpreting the quantity being counted. This is valuable in contexts where

numerals are being used atypically, as conventional transliterations can otherwise force a dubious interpretation. For instance, the [CDLI] transliteration of **DDD** or **BBB** in [P283802, rev. 16, 2 2] currently uses (barig@c) for the vertical numerals, since \square numerals are typically capacity measures; but [Gor23] interprets these instead as counting linen textiles. As a result, the fourth millennium conventions for numeral transliteration are used in Early Dynastic texts, especially those from the ED I-II period, even though the Sumerian text uses classical assyriological transliteration conventions; see [Chao3, p. 6 n. 27].

While the non-numeric signs are treated as undeciphered, the metrological systems used in the fourth millennium are well understood, as can be seen in [DE87, p. 165]. As a result, contrary to the non-numeric proto-cuneiform conventions, these numeric transliteration conventions are compatible with the classical ones described in §3.7.2; they are indeed used interchangeably, as in [Po11104] which uses the notation u@f in [ePSD2], but N14@f in [CDLI]. Indeed, the numerals are used similarly in Early Dynastic metrological systems, and are visually identical.

A disunification of numerals between the third and fourth millennium would therefore induce confusion as to which numerals should be used in third millennium studies, and would needlessly duplicate the encoding of at least seventy characters; by splitting the attestations, these separate encoding proposals would run into additional difficulties to supply evidence for encoding.

Note that the structural variants designated by letters in fourth millennium notation have systematically been encoded, as they have occasionally been found to carry distinct numeric meaning. For instance, **N_{30c}** is listed as a variant of **N_{30a}** in [DE87, p. 166], where the numeric value of either in relation to \square **N_{39a}** is still unknown, but their values are found in [Engo4, p. 33] to be $\square = \frac{1}{10} \square$, whereas $\square = \frac{1}{6} \square$.

5 Considerations on individual numeral series

Usages of the characters U+12550–U+12597, under subheadings “Common Numerals”, “Numerals used for land areas”, and “Early Dynastic capacity measures”, have already been discussed in §3.4. The variant forms of fractions of the iku are not unifiable with the ordinary ones: $\ddot{\square}$ is never used as a capacity measure, nor as one half in any other metrological system, contrary to \square .

The character $\ddot{\square}$ represents both the usages $\frac{1}{2}$ and 1 ban₂, whereas U+12226 **+** CUNEIFORM SIGN MASH and U+1244F **+** CUNEIFORM NUMERIC SIGN ONE BAN2 are disunified. This disunification is motivated by the unrelated origins of maš (logographic, meaning “goat”), always resembling $\ddot{\square}$, and 1 ban₂, descended from \square . One could argue that based on their etymologies, U+1244F would make more sense as the sign used for $\frac{1}{2}$, but U+12226 is used as the transliteration MAŠ is frequent, see, e.g., [Hue11, p. 165].

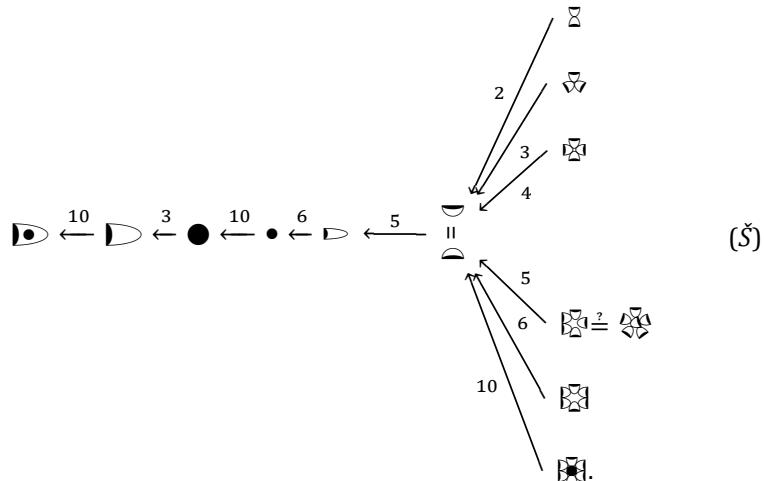

The signs U+12598 **☒** and U+12599 **☒** are used in the ED IIIb Nirsu weight system for fractions $\frac{1}{3}$ and $\frac{2}{3}$ of a shekel, with the already-encoded U+1245D **☒** and U+1245E **☒** used for fractions of a mina, see [Lec16]. Note that as usual, the description $\square \times (\square + n\square)$ must be understood as allowing for free variation between **☒**, **☒**, and **☒**, the last one being the description in [Lec16]. Compare **☒** discussed in [UTR56, §2.5], **☒** šešsig = **☒** \times **☒** = **☒** \times **☒** (the last one in, e.g., Ebla lexical texts).

The characters U+12550–U+12597 are used in the bisexagesimal counting system, whose factor diagram is as follows [Fri78, p. 15; DE87, p. 165; NDE93, p. 28], with \square being the unit:

$$\bullet \xleftarrow{6} \square \xleftarrow{10} \square \xleftarrow{2} \square \xleftarrow{6} \bullet \xleftarrow{10} \square \xleftarrow{2} \square. \quad (B)$$

This system is used to count rations of discrete dry grain products, cheese, and fresh fish; see [DE87, pp. 132–134][28]NissenDamerowEnglund1993[34]Englund2004. It is well attested in the fourth millennium, but is also attested in Early Dynastic IIIa Šuruppag. The reference glyph for \bullet is based on the design in [DE87; NDE93], rather than the one in [Eng04; Eng23], as the latter requires the use of grey, whereas the earlier one is black and white. The highest attested number in this system is $\bullet\bullet\frac{\square}{\square}\square$, in [P003595].

The characters U+12597–U+125B0, U+125B6–U+125BD are used in the grain capacity system [DE87, pp. 136–139, 165; NDE93, p. 28; Eng01, p. 4; Eng04, pp. 33, 39]:

The signs U+125B1–U+125B5 are listed together with them in [Eng01, p. 29] under “dry cereal products and rations: numerical signs in ideographic use”. Since the \bullet numerals up to $5\bullet$ are encoded based on their use in system S , there is no need to find the highest attested quantity measured in system \check{S} .

The characters U+125BE–U+125D0 are used in a variant of system S used to count dead animals, as well as and jars of certain types of beer; see [DE87, p. 131; NDE93, p. 28; Eng04, p. 40 n. 23]:

$$\square \xleftarrow{6} \bullet \xleftarrow{10} \square. \quad (S')$$

The highest attested number in this system is $\square\square\square\square\square\square$, 306 dead sheep, in [P006365]. The sign \square is also used in a liquid capacity system, see [DE87, p. 131; NDE93, p. 29; Eng04, p. 33].

The characters U+125D1–U+125E9 are used in a variant of the bisexagesimal system used to count a certain kind of rations, possibly a type of fish; see [DE87, pp. 135, 165; NDE93, p. 28]:

$$\square \xleftarrow{10} \square \xleftarrow{2} \square \xleftarrow{6} \bullet \xleftarrow{10} \square. \quad (B*)$$

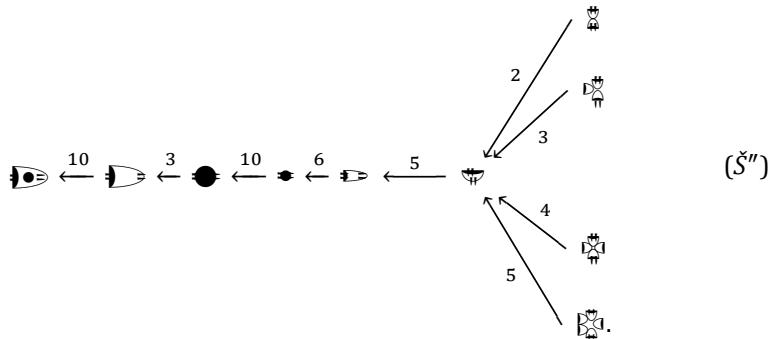

The highest well-preserved number in this system is $\square\square\square$ in [P005153]; there is also a damaged $\square\square\square$ in [P004804].

The characters U+125EA–U+125FD are used in a variant of system \check{S} probably used to measure malted barley, see [DE87, p. 139; NDE93, p. 29; Eng01, p. 17 n. 30]:

$$\bullet \xleftarrow{10} \cdot \xleftarrow{6} \square \xleftarrow{5} \square \xleftarrow{2} \boxtimes \quad (\check{S}')$$

The highest attested quantity in this system is $\bullet \cdot \square \square \boxtimes$, in [P005363]. The numeral $\bullet N_{45a}$ is not included in [DE87, pp. 165 sq.], and the numeral $\boxtimes N_{24a}$ appears there only in brackets, without a name; both appear in [NDE93, p. 29; Eng04, p. 33] with the names N_{45}' and N_{24}' , and are listed in [Eng23] with their ATF names N45~a and N24~a. They are attested in [CDLI] transliterations.

The characters U+125FE–U+12622 are used in a variant of system \check{S} probably used to measure emmer, see [DE87, p. 140, p. 155 n. 67; NDE93, p. 29]:

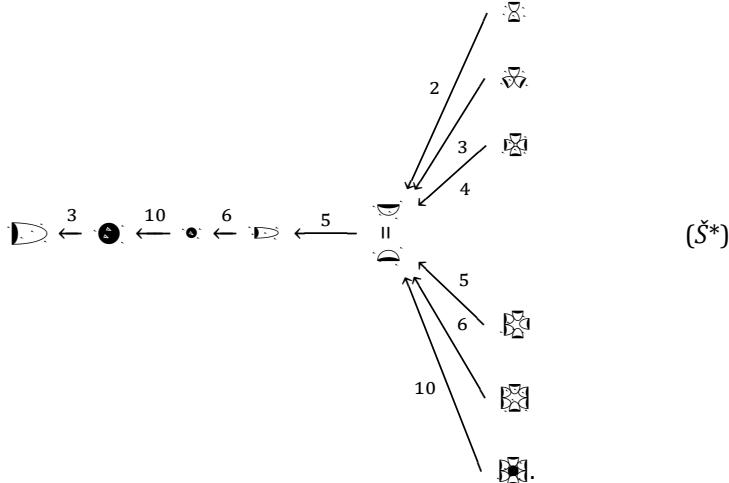

The fractions are not listed in any of [DE87; NDE93; Eng04], but those that are included are attested in [CDLI] and listed in [Eng23]. As noted in [DE87, p. 140] $\bullet N_{46}$ appears to also represent a quantity larger than \square , with $3\bullet 2\square 5\square 2\square 1\square$ attested in [P003330]. [DE87, p. 140] suggests $\bullet = 6\square$ based on proto-Elamite $\bullet = 6\square$, with the factor diagram

$$\bullet \xleftarrow{6?} \square \xleftarrow{10} \square \xleftarrow{3} \bullet \xleftarrow{10} \square \xleftarrow{6} \square \xleftarrow{5} \square$$

reused in later works. Given that this ratio is questionable, and that $5\square$ is not attested, we have neither included $5\square$ nor $3\bullet$. The highest attested clearly understood quantity in this system is $\bullet \square \square \bullet \square \square \bullet \square \square$ in [P002673].

The characters U+12623–U+12642 are used in a variant of system \check{S} probably used to measure barley groats, see [DE87, p. 141; NDE93, p. 29; Eng01, p. 3 n. 7, p. 17

n. 30].

The fractions $\frac{1}{2}$, $\frac{1}{3}$, and $\frac{1}{4}$ are listed in [DE87], the last one in brackets without a name. $\frac{1}{5}$ is called N_{28*} in [NDE93, p. 29; Engo4, p. 33]. All fractions included here are attested in [CDLI] transliterations and listed in [Eng23]. The highest attested quantity is $\frac{1}{10}$ in [Poo5461].

The characters U+12643–U+1264B are used in a system whose function is unknown, attested only in the Uruk IV period, see [DE87, pp. 143 sq.; NDE93, pp. 27 sq.]:

$$\bullet \xleftarrow{10} \square \xleftarrow{2} \frac{1}{2} \xleftarrow{2} \frac{1}{3} \xleftarrow{4} \frac{1}{4} \xleftarrow{5} \frac{1}{5} \xleftarrow{6} \frac{1}{6} \xleftarrow{10} \frac{1}{10}. \quad (E)$$

Again as the higher numerals are common, there is no need from a character encoding perspective to search for the highest attested quantity.

The “flat” characters U+1264C–U+12686 are used in various metrological systems in ED I–II Ur, see the factor diagrams in [Chao3, pp. 4 sq.]. These factor diagrams determine most of the upper bounds for the encoded numerals. The highest attested quantity in the “Cereal 2 system” with rectangular signs (similar to system Š”) is $\frac{1}{10}$ in [Poo5773]. The glyphs in [Eng23; L2/23-190] suggest the use of two flat tools, one large and one small, as for the curviform signs. However, the signs all appear to have the same width in photographs; the glyphs in [Chao3] are also consistent with a single flat tool. The glyphs have been adjusted accordingly.

6 Characters not included in this proposal

Some numerals previously proposed in [L2/23-190], as well as some other numerals known to exist in the third millennium, are not included in this proposal. Some should be proposed at a later date; others are likely not encodable.

6.1 Fourth millennium numerals

The following eight numeral series from [DE87, p. 166] are not included; they are all listed as under *Nichteinordnbare Zahlzeichen* in [DE87, p. 147]. On these (and two others, possibly N_{57} and N_{58}), [NDE93, p. 27] write “Ten of the sixty numerical signs contained in the list in figure 27, moreover, do not belong to any of the identified

systems. Three of them were apparently scribbled by an awkward pupil. As to four of those remaining, we are not sure whether they constitute derivations of other, as yet unknown numerical signs or whether they are in fact numerical signs at all. For at least two of the ten signs, [N_{23}] and [N_{43}], we can affirm that each formed part of two additional systems, about which we know nothing due to the fact that no informative texts have been unearthed with notations in these systems.”

- N_{13} ፩. [DE87, p. 147] mentions [P002551] as the only attestation. [CDLI] now transliterates this 2(N04), not in [Eng23]. Presumably representable as a rotated ፪, as here.
- N_{16} and N_{17} . Described as “*vermutlich mit ideographischer Funktion*” in [DE87, p. 147]. N_{17} is only attested in [P000524], a witness to [Q000028]. N_{16} is attested in similar context in the same [P000524], but also in other artefacts, including [P283918] and [P283919] where notes by Englund in the [CDLI] transliteration suggest it is numeric, equal to $\frac{1}{20}$ ፻. N_{16} should probably be encoded in the Archaic Cuneiform Numerals block.
- N_{23} . In the current transliterated [CDLI] corpus, attested in one Uruk V artefact, and four Uruk IV artefacts. Similar in shape to proto-Elamite N_{23} , which is well-attested (53 artefacts) and well-understood (part of a decimal system, where it means 100). Best encoded as part of a proto-Elamite proposal, where we would clearly have 1–9, and given appropriate Script_Extensions.
- N_{43} ; according to [DE87, p. 147], probably part of a variant of system ፲.
- N_{44} , N_{53} , and N_{55} : Only attested in [P003855], which contains no other text. Presumably these are the “awkward pupil” signs.

In addition, the following are not included:

- N_{10} . Only attested in [P001319] according to [DE87, p. 143], but that text now has N_{11} in its [CDLI] transliteration. Not in [Eng23].
- N_{57} and N_{58} . Dependent on the main proto-cuneiform proposal, whose rationale will justify the disunification from 一 and 丨. These should be encoded in a different block to avoid confusion with 一 and 丨, since the Archaic Numerals block contains numerals unifiable between Pcus and Xsux.
- N_{59} . Possibly a variant of ፪ according to [DE87, p. 147].
- N_{30b} . Not attested in [CDLI] transliterations, not included in Englund’s more recent works such as [Eng01, p. 29], nor in [Eng23].

The well-understood U₄ numerals, documented in [Eng88, pp. 136 sqq.] and listed in [Eng23; L2/23-190], have not been included as they are likewise dependent on the disunification of proto-cuneiform, and should be encoded in a different block to avoid confusion with ፳. Some additional numeral series from [Eng23; L2/23-190] are not included due to lack of documentation on their usage. In general, only numerals that are part of a well-understood metrological system have been included. In particular, numerals such as 12• (attested in [P200010]) have not been encoded, since the metrological systems involving • numerals should not allow for a numeral beyond ፯••• (9•).

In addition, numerals that are not attested have not been included, unless they are part of a series where higher numerals in the metrological system are attested; thus the unattested 𒁹 and 𒁻, which are not in [Eng23], are included, because 𒁹 is attested in [Poo6365], in a context where it is clearly used as part of system *S'*. However, 1(N30C~b), which is in [Eng23], and is the obvious counterpart of 𒁹 in system *S''*, therefore presumably equal to $\frac{1}{10}$ 𒂵, is not included, as it is not attested in [CDLI] transliterations at this time.

6.2 Third millennium numerals

The sign N_{48}^f listed in [Eng23; L2/23-190] only has questionable attestations in [CDLI] transliterations, and is not mentioned in [Chao3]. It has not been included.

The metrological systems from Early Dynastic IIIb Nirsu discussed in §3.4 require the numerals 7𒃪, 8𒃪, and 9𒃪, whereas only 𒃪-𒃪 are encoded. 𒃪 numerals are also used in dates. The higher numerals are less frequent, as subtractive notation is often used instead, *e.g.*, 𒃪-𒃪 rather than 9𒃪, or 𒃪-𒃪-𒃪 rather than 𒃪-𒃪-𒃪, which is presumably why they are not yet encoded. However, they are clearly attested and understood enough to be encodable. They should be encoded in the Cuneiform Numbers and Punctuation block.

Early Dynastic IIIb Nirsu regnal years use 𒃪-𒃪 numerals (1–9). These are extremely well attested: a [CDLI] search for "(|ASZxDISZ@t|)" finds 1482 artefacts, all ED IIIb, of which 1447 are from Nirsu. These could be encoded in the Cuneiform Numbers and Punctuation block; together with 7–9𒃪, this would fill the block. There are three attestations of 𒃪-𒃪 numerals for regnal years of 𒈗-𒈗-𒈗, one of which is damaged, and none of which have photographs. Absent further evidence, these seem unifiable with 9𒃪.

Some Old Akkadian artefacts have 𒃪-𒃪 (LAK 824) or 𒃪-𒃪, which has recently been found to mean 6000. The [CDLI] transliterations do not appear to distinguish the curviform and cuneiform versions of these signs. These signs appear to be associated with 6𒃪 or 6𒃪. Further collation⁸³ is needed to understand exactly what needs to be encoded.

[Chao3, p. 5; Chai2, p. 61] mention a sign resembling a mirrored and rotated 𒂵, thus 𒂷. It is transliterated N_1' in [Chao3, p. 5], which documents a metrological system that uses it. However, we have not been able to locate this sign in the ED I-II Ur corpus nor in the Ebla corpus, as it is unclear how it is transliterated in [CDLI] or [EbDA]. Once found, it will likely be proposed for encoding in the Archaic Cuneiform Numerals block.

6.3 Stacking patterns

The already-encoded numerals in the Cuneiform Numbers and Punctuation block distinguish some *stacking patterns*; for instance 9𒃪 is encoded both as U+12446 𒃪 and as U+1240E 𒃪. This is in part due to contrastive usage of stacking patterns. For instance, besides 𒃪 and 𒃪 which are characteristic of bariga measures, four bariga is written 𒃪 even where 4𒃪 is written 𒃪, as in [P255010, obv. 2 3, rev. 1 17; P292843, obv. 4, rev. 5]. Another contrast is that between the stacking patterns used in scratch calculations in the SPVS, often 𒃪 𒃪 𒃪 𒃪 𒃪 𒃪 𒃪 𒃪 < « « « «, and results in metrological systems, typically 𒃪 𒃪 𒃪 𒃪 𒃪 𒃪 𒃪 𒃪 < « « «.

⁸³In the assyriological sense, not the Unicode sense.

Figure 23: The layout of case [P011099, rev. 2 3]; the numeral ● is rotated to fit the rounded corner of the tablet.

Figure 24: The layout of case [P020066, obv. 11]; the numeral ● is spread across two lines. The text is read in the order ●●▷◁◁, “twenty-two oxen, one year old”.

« «, occasionally co-occurring as in [P142827; P142357]. This separate encoding is also for compatibility with distinctions made in reference works and in some non-numeric transliterations; for instance, 𒈗 is [Bor10, MZL 860] and has the value limmu, whereas 𒈙 is [Bor10, MZL 852] and has the value limmu₅. Numeric⁸⁴ transliterations occasionally distinguish the stacking patterns 𒈗 𒈗 𒈗 𒈗 𒈗 « «, as in the [CDLI] transliterations of the aforementioned tablets, although this is rare; often 4(diš) is 𒈙 in Ur III, but 𒈗 in the Neo-Assyrian period.

However, the stacking patterns from earlier periods are not separately encoded; for instance, in ED IIIb Nirsu, « 2(u) often has one < atop another. These older stacking patterns do not appear to be contrastive, are not marked in transliteration, and are not listed separately in sign lists nor assigned any different values. There is therefore no evidence of a need to encode them; instead, they should be considered style variants, and an ED IIIb Nirsu font should have an appropriate glyph for U+12399 « CUNEIFORM SIGN U U.

Likewise, many stacking patterns are attested for the curviform numerals proposed in this document, and it is not proposed to separately encode them. These distinctions would be incompatible with the state of the art in numeric transliterations, including those by Englund, who insisted on “a system of transliteration that reflects in a strict fashion the physical realities of the cuneiform inscriptions” [Eng04, p. 30], and they are not needed to represent reference works. Idiosyncratic stacking patterns are in fact particularly common in Early Dynastic and earlier tablets, as they are structured in rectangular cases rather than lines, so that numerals may be laid out across the case in whichever way fits the available space; this is illustrated in Figure 23. Note also that the numerals need to be considerably enlarged in order to reproduce the layout of the tablets, so that ● often spans two lines of cuneiform signs, as shown in Figure 24. This is impractical when these numerals are set in text that contrasts them with the larger ▷, and inconsistent with actual practice when typesetting these numerals, as illustrated in Figure 8: reproducing the layout of tablets is not within the scope of plain text.

The reference glyphs use stacking patterns that are common in the Early Dynastic period, but that are also attested in the fourth millennium in the Uruk III period; the fourth millennium, especially the Uruk IV period, also frequently features numerals that use a more vertical layout, as illustrated in Figure 25. The later,

⁸⁴The Sumerian word limmu means “four”, so limmu and limmu₅ are still numbers. The distinction here is between usage in transliterations of phrases such as 𒉩 𒉪 𒉣 𒉦 𒈗 𒈙 4(lugal an-ub-da limmu₅-ba-ke₄) (king of the four quarters) or of names, and of numeric expressions such as 𒈙 4(diš) sila₃.

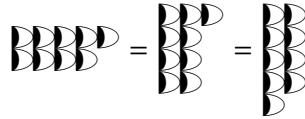

Figure 25: Three stacking patterns for U+12573 CUNEIFORM NUMERIC SIGN NINE N34. The one on the left is the reference glyph, used in Uruk III [[P003499](#), obv. 1 1b; [P004430](#), rev. 1 2], and widely afterwards, e.g., ED IIIa Šuruppag [[P010678](#), obv. 2], ED IIib Nirsu [[P020057](#), obv. 1 3], Old Akkadian Umma [[P212464](#), obv. 11]. The ones in the middle and right are used in two Uruk IV tablets [[P001243](#), rev. [P004500](#), rev. 2]. All three Uruk examples are transliterated 9(N34) in [CDLI].

IN₂₆	Uruk IV: <i>ATU</i> 5, pl. 32, W 8273 obv. i 1; pl. 34, W 9071.f obv. ii 1 (qualifying U ₁); pl. 42, W 9169.c obv. i 5, ii 4 (?; qualifying DU ₈), rev. i 1 (together with N ₁₉₀ , N ₂₄ and N ₁₉); pl. 108, W 9656.fm obv. i 1.
Uruk III: <i>ATU</i> 2, pl. 57, W 16719 obv. i 4; <i>ATU</i> 5, pl. 1, W 5233.a obv. i 3; pl. 2, W 5233.b obv. i 3; pl. 2, W 5233.c obv. i 3; <i>BagM</i> 22, 143, W 24187 obv. i 3; W 16465 obv. i 4; W 17440 obv. i 4; <i>Archaic Bookkeeping</i> 42, fig. 38, obv. i 2a; <i>ATU</i> 1, 632 iv 4 (?); <i>MSVO</i> 4, 66 obv. i 3a.	Uruk IV: <i>ATU</i> 2, pl. 56, W 15920.a2 obv. i 1 (qualifying GAR); <i>ATU</i> 5, pl. 42, W 9169.c obv. ii 2 (?).
IN_{29a}	Uruk III: <i>ATU</i> 3, pl. 88, W 16918.g obv. i 1 (possibly lexical); <i>Archaic Bookkeeping</i> 42, fig. 38, obv. i 4a; <i>MSVO</i> 4, 66 obv. i 5a.
IN_{29b}	

Figure 26: Variants of $\text{N} \ddot{\text{v}}$ and $\text{N} \ddot{\text{x}}$ from [Eng01, p. 31].

more horizontal styles were chosen for two reasons: for the numerals used in the third and fourth millennium, usage in third millennium scholarship will be more frequent; and the horizontal layout poses fewer layout difficulties when set in lines of non-cuneiform text, as most modern scholarship is. Indeed, the absolute size of the indents \square , \square , \bullet , and \bullet must remain consistent across the numeral series, lest a \square numeral be confused with an \square numeral. Since the single indents are frequently used in running text, as illustrated in §3.4.5, they need to be large enough that the vertical stacking patterns are impractical.

Variant stacking patterns, if needed, may be handled at a higher level as stylistic distinctions; Figure 25 uses OpenType stylistic alternates, and Figure 23 rotates the character \bullet , in both cases preserving the plain text backing.

6.4 Other glyph variants not reflected in transliteration

In addition to stacking patterns proper, [L2/23-190, pp. 128 sq.] proposes separately encoding variant glyphs that are not distinguished in transliteration, but are listed (under the same name) in [Eng23], thus proposing two characters for $\text{N} \ddot{\text{v}}$ and two characters for $\text{N} \ddot{\text{x}}$. These are merely illustrative of a wide continuum of attested glyphs; there are additional variants, as shown in Figure 26, and a cursory search on [CDLI] will find many attestations with further variation in the same vein. They should not be encoded. Only the systematic structural variants, which have been distinguished in transliteration based on a suspicion of distinct semantics, should be encoded.

ISO/IEC JTC 1/SC 2/WG 2
PROPOSAL SUMMARY FORM TO ACCOMPANY SUBMISSIONS
FOR ADDITIONS TO THE REPERTOIRE OF ISO/IEC 10646¹.

Please fill all the sections A, B and C below.

Please read Principles and Procedures Document (P & P) from <http://std.dkuug.dk/JTC1/SC2/WG2/docs/principles.html> for guidelines and details before filling this form.

Please ensure you are using the latest Form from <http://std.dkuug.dk/JTC1/SC2/WG2/docs/summaryform.html>.
See also <http://std.dkuug.dk/JTC1/SC2/WG2/docs/roadmaps.html> for latest Roadmaps.

A. Administrative

1. Title:	Archaic Cuneiform Numerals	
2. Requester's name:	Robin Leroy	
3. Requester type (Member body/Liaison/Individual contribution):	Individual contribution	
4. Submission date:	2024-09-14	
5. Requester's reference (if applicable):		
6. Choose one of the following: This is a complete proposal: (or) More information will be provided later:	YES	

B. Technical – General

1. Choose one of the following: a. This proposal is for a new script (set of characters): Proposed name of script:	YES	
b. The proposal is for addition of character(s) to an existing block: Name of the existing block:		
2. Number of characters in proposal:		
3. Proposed category (select one from below - see section 2.2 of P&P document): A-Contemporary <input type="checkbox"/> B.1-Specialized (small collection) <input type="checkbox"/> B.2-Specialized (large collection) <input type="checkbox"/> C-Major extinct <input type="checkbox"/> D-Attested extinct <input type="checkbox"/> E-Minor extinct <input type="checkbox"/> F-Archaic Hieroglyphic or Ideographic <input checked="" type="checkbox"/> G-Obscure or questionable usage symbols <input type="checkbox"/>		
4. Is a repertoire including character names provided? a. If YES, are the names in accordance with the "character naming guidelines" in Annex L of P&P document? b. Are the character shapes attached in a legible form suitable for review?	YES	
5. Fonts related: a. Who will provide the appropriate computerized font to the Project Editor of 10646 for publishing the standard? Robin Leroy		
b. Identify the party granting a license for use of the font by the editors (include address, e-mail, ftp-site, etc.): Robin Leroy (eggrobin@unicode.org)		
6. References: a. Are references (to other character sets, dictionaries, descriptive texts etc.) provided? b. Are published examples of use (such as samples from newspapers, magazines, or other sources) of proposed characters attached?	YES	
7. Special encoding issues: Does the proposal address other aspects of character data processing (if applicable) such as input, presentation, sorting, searching, indexing, transliteration etc. (if yes please enclose information)?	YES	
8. Additional Information: Submitters are invited to provide any additional information about Properties of the proposed Character(s) or Script that will assist in correct understanding of and correct linguistic processing of the proposed character(s) or script. Examples of such properties are: Casing information, Numeric information, Currency information, Display behaviour information such as line breaks, widths etc., Combining behaviour, Spacing behaviour, Directional behaviour, Default Collation behaviour, relevance in Mark Up contexts, Compatibility equivalence and other Unicode normalization related information. See the Unicode standard at http://www.unicode.org for such information on other scripts. Also see Unicode Character Database (http://www.unicode.org/reports/tr44/) and associated Unicode Technical Reports for information needed for consideration by the Unicode Technical Committee for inclusion in the Unicode Standard.		

¹. Form number: N4502-F (Original 1994-10-14; Revised 1995-01, 1995-04, 1996-04, 1996-08, 1999-03, 2001-05, 2001-09, 2003-11, 2005-01, 2005-09, 2005-10, 2007-03, 2008-05, 2009-11, 2011-03, 2012-01)

C. Technical - Justification

1. Has this proposal for addition of character(s) been submitted before?	<input type="checkbox"/> NO
If YES explain: _____	
2. Has contact been made to members of the user community (for example: National Body, user groups of the script or characters, other experts, etc.)?	<input type="checkbox"/> YES
If YES, with whom? <i>Karljürgen Feuerherm, Erica Scarpa, and Steve Tinney.</i>	
If YES, available relevant documents: <i>This document.</i>	
3. Information on the user community for the proposed characters (for example: size, demographics, information technology use, or publishing use) is included?	<input type="checkbox"/> YES
Reference: <i>This document.</i>	
4. The context of use for the proposed characters (type of use; common or rare)	<input type="checkbox"/> rare
Reference: _____	
5. Are the proposed characters in current use by the user community?	<input type="checkbox"/> YES
If YES, where? Reference: <i>Scholarly publications. This document, §3.4.5.</i>	
6. After giving due considerations to the principles in the P&P document must the proposed characters be entirely in the BMP?	<input type="checkbox"/> NO
If YES, is a rationale provided?	
If YES, reference: _____	
7. Should the proposed characters be kept together in a contiguous range (rather than being scattered)?	<input type="checkbox"/>
8. Can any of the proposed characters be considered a presentation form of an existing character or character sequence?	<input type="checkbox"/> NO
If YES, is a rationale for its inclusion provided?	
If YES, reference: _____	
9. Can any of the proposed characters be encoded using a composed character sequence of either existing characters or other proposed characters?	<input type="checkbox"/> NO
If YES, is a rationale for its inclusion provided?	
If YES, reference: _____	
10. Can any of the proposed character(s) be considered to be similar (in appearance or function) to, or could be confused with, an existing character?	<input type="checkbox"/> NO
If YES, is a rationale for its inclusion provided?	
If YES, reference: _____	
11. Does the proposal include use of combining characters and/or use of composite sequences?	<input type="checkbox"/> NO
If YES, is a rationale for such use provided?	
If YES, reference: _____	
Is a list of composite sequences and their corresponding glyph images (graphic symbols) provided?	
If YES, reference: _____	
12. Does the proposal contain characters with any special properties such as control function or similar semantics?	<input type="checkbox"/> NO
If YES, describe in detail (include attachment if necessary)	

13. Does the proposal contain any Ideographic compatibility characters?	<input type="checkbox"/> NO
If YES, are the equivalent corresponding unified ideographic characters identified?	
If YES, reference: _____
